Problem Sheet 1

Zbigniew Palmowski

1. The current price of a certain non-dividend-paying stock is $\$ 100$ per share. You are modeling the price of this stock at the end of a quarter year using a one-period binomial tree under the assumption that the stock price can either increase by $4 \%$, or decrease by $2 \%$. The continuously compounded risk-free interest rate is $3 \%$. What is the price of a three-month, at-the-money European call option on the above stock consistent with the above binomial tree?
2. Let the continuously compounded risk-free interest rate be equal to 0.04 . The current price of a continuous-dividend-paying stock is $\$ 80$ and its dividend yield is 0.02 . The stock's volatility is 0.25 . You model the evolution of the stock price over the following half year using a two-period forward binomial tree. What is the price of a six-month, $\$$ 82 -strike European put option on the above stock consistent with the given binomial tree?
3. The current price of a continuous-dividend-paying stock is $\$ 100$ per share. Its volatility is given to be 0.2 and its dividend yield is 0.03 . The continuously compounded riskfree interest rate equals 0.06 . Consider a $\$ 95$-strike European put option on the above stock with nine months to expiration. Using a three-period forward binomial tree, find the price of this put option.
4. Consider a non-dividend-paying stock whose current price is $\$ 100$ per share. Its volatility is given to be 0.25 . You model the evolution of the stock price over the following year using a two-period forward binomial tree. The continuously compounded risk-free interest rate is 0.04 . Consider a $\$ 110$-strike, one-year down-and-in put option with a barrier of $\$ 90$ on the above stock. What is the price of this option consistent with the above stock-price model.
5. The current stock price is observed to be $\$ 100$ per share. The stock is projected to pay dividends continuously at the rate proportional to its price with the dividend yield of 0.03 . The stock's volatility is given to be 0.23 . You model the evolution of the stock price using a two-period forward binomial tree with each period of length one year. The continuously compounded risk-free interest rate is given to be 0.04 . What is the price of a two-year, $\$ 101$-strike American put option on the above stock consistent with the above stock-price tree?
