Abstract

We study the semigroup of the symmetric $\alpha$-stable process in bounded domains in $\mathbb{R}^d$. We obtain a variational formula for the spectral gap, i.e. the difference between two first eigenvalues of the generator of this semigroup. This variational formula allows us to obtain lower bound estimates of the spectral gap for convex planar domains which are symmetric with respect to both coordinate axes. For rectangles, using "midconcavity" of the first eigenfunction [5], we obtain sharp upper and lower bound estimates of the spectral gap.

1 Introduction

In recent years many results have been obtained in spectral theory of semigroups of symmetric $\alpha$-stable processes $\alpha \in (0, 2)$ in bounded domains in $\mathbb{R}^d$, see [6], [25], [2], [18], [19], [14], [15], [5]. One of the most interesting problems in spectral theory of such semigroups is a spectral gap estimate i.e. the estimate of $\lambda_2 - \lambda_1$ the difference between two first eigenvalues of the generator of this semigroup. Such estimate is a natural generalisation of the same problem for the semigroup of Brownian motion killed on exiting

---

Key words and phrases: symmetric stable process, spectral gap, convex domain

The second named author was supported by KBN grant 1 P03A 020 28 and RTN Harmonic Analysis and Related Problems, contract HPRN-CT-2001-00273-HARP.
a bounded domain, which generator is Dirichlet Laplacian. In this classical
case, for Brownian motion, spectral gap estimates have been widely studied
see e.g [26], [28], [24], [27], [17], [7]. When a bounded domain is convex there
have been obtained sharp lower-bound estimates of the spectral gap.

In the case of the semigroup of symmetric $\alpha$-stable processes $\alpha \in (0, 2)$
very little is known about the spectral gap estimates. In one dimensional
case when a domain is just an interval spectral gap estimates follow from
results from [2] ($\alpha = 1$) and [14] ($\alpha > 1$). The only results for dimension
greater than one have been obtained for the Cauchy process i.e. $\alpha = 1$ [3],
[4]. Such results have been obtained using the deep connection between the
eigenvalue problem for the Cauchy process and a boundary value problem for
the Laplacian in one dimension higher, known as the mixed Steklov problem.

The aim of this paper is to generalise spectral gap estimates obtained for
the Cauchy process ($\alpha = 1$) for all $\alpha \in (0, 2)$. Before we describe our results
in more detail let us recall definitions and basic facts.

Let $X_t$ be a symmetric $\alpha$-stable process in $\mathbb{R}^d$, $\alpha \in (0, 2]$. This is a
process with independent and stationary increments and characteristic func-
tion $E^{0} e^{i\xi X_t} = e^{-|\xi|^\alpha}$, $\xi \in \mathbb{R}^d$, $t > 0$. We will use $E^x$, $P^x$ to denote the
expectation and probability of this process starting at $x$, respectively. By
$p(t, x, y) = p_t(x - y)$ we will denote the transition density of this process.
That is,

$$P^x(X_t \in B) = \int_B p(t, x, y) \, dy.$$  

When $\alpha = 2$ the process $X_t$ is just the Brownian motion in $\mathbb{R}^d$ running at
twice the speed. That is, if $\alpha = 2$ then

$$p(t, x, y) = \frac{1}{(4\pi t)^{d/2}} e^{-|x-y|^2/4t}, \quad t > 0, \ x, y \in \mathbb{R}^d.  \tag{1.1}$$

It is well known that for $\alpha \in (0, 2)$ we have $p_t(x) = t^{-d/\alpha} p_1(t^{-1/\alpha}x)$, $t > 0$,
$x \in \mathbb{R}^d$ and

$$p_t(x) = t^{-d/\alpha} p_1(t^{-1/\alpha}x) \leq t^{-d/\alpha} p_1(0) = t^{-d/\alpha} M_{d,\alpha},$$

where

$$M_{d,\alpha} = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-|x|^\alpha} \, dx.  \tag{1.2}$$

It is also well known that

$$\lim_{t \to 0^+} \frac{p(t, x, y)}{t} = \frac{A_{d,-\alpha}}{|x - y|^{d+\alpha}}.  \tag{1.3}$$
where
\[ A_{d,\gamma} = \Gamma((d - \gamma)/2)/(2^{\gamma} \pi^{d/2}|\Gamma(\gamma/2)|). \] (1.4)

Our main concern in this paper are the eigenvalues of the semigroup of the process \( X_t \) killed upon leaving a domain. Let \( D \subset \mathbb{R}^d \) be a bounded connected domain and \( \tau_D = \inf\{t \geq 0 : X_t \notin D\} \) be the first exit time of \( D \). By \( \{P_t^D\}_{t \geq 0} \) we denote the semigroup on \( L^2(D) \) of \( X_t \) killed upon exiting \( D \). That is,
\[ P_t^D f(x) = E_x^x(f(X_t), \tau_D > t), \quad x \in D, \ t > 0, \ f \in L^2(D). \]

The semigroup has transition densities \( p_t(x,y) \) satisfying
\[ P_t^D f(x) = \int_D p_t(x,y)f(y)\,dy. \]

The kernel \( p_t(x,y) \) is strictly positive symmetric and
\[ p_t(x,y) \leq p(t,x,y) \leq M_{d,\alpha} t^{-d/\alpha}, \quad x,y \in D, \ t > 0. \]

The fact that \( D \) is bounded implies that for any \( t > 0 \) the operator \( P_t^D \) maps \( L^2(D) \) into \( L^\infty(D) \). From the general theory of semigroups (see [16]) it follows that there exists an orthonormal basis of eigenfunctions \( \{\varphi_n\}_{n=1}^\infty \) for \( L^2(D) \) and corresponding eigenvalues \( \{\lambda_n\}_{n=1}^\infty \) satisfying
\[ 0 < \lambda_1 < \lambda_2 \leq \lambda_3 \leq \ldots \]
with \( \lambda_n \to \infty \) as \( n \to \infty \). That is, the pair \( \{\varphi_n, \lambda_n\} \) satisfies
\[ P_t^D \varphi_n(x) = e^{-\lambda_n t} \varphi_n(x), \quad x \in D, \ t > 0. \] (1.5)

The eigenfunctions \( \varphi_n \) are continuous and bounded on \( D \). In addition, \( \lambda_1 \) is simple and the corresponding eigenfunction \( \varphi_1 \), often called the ground state eigenfunction, is strictly positive on \( D \). For more general properties of the semigroups \( \{P_t^D\}_{t \geq 0} \), see [21], [8], [12].

It is well known (see [1], [12], [13], [23]) that if \( D \) is a bounded connected Lipschitz domain and \( \alpha = 2 \), or that if \( D \) is a bounded connected domain for \( 0 < \alpha < 2 \), then \( \{P_t^D\}_{t \geq 0} \) is intrinsically ultracontractive. Intrinsic ultracontractivity is a remarkable property with many consequences. It implies, in particular, that
\[ \lim_{t \to \infty} e^{\lambda_1 t} p_D(t,x,y) = 1, \]
\[ \varphi_1(x) \varphi_1(y) = 1. \]
uniformly in both variables \( x, y \in D \). In addition, the rate of convergence is given by the spectral gap \( \lambda_2 - \lambda_1 \). That is, for any \( t \geq 1 \) we have

\[
e^{- (\lambda_2 - \lambda_1) t} \leq \sup_{x, y \in D} \left| \frac{e^{\lambda_1 t} p_D(t, x, y)}{\varphi_1(x) \varphi_1(y)} - 1 \right| \leq C(D, \alpha) e^{- (\lambda_2 - \lambda_1) t}.
\] (1.6)

The proof of this for \( \alpha = 2 \) may be found in [27]. The proof in our setting is exactly the same.

Our first step in studying the spectral gap for \( \alpha \in (0, 2) \) is the following variational characterisation of \( \lambda_2 - \lambda_1 \).

By \( L^2(D, \varphi_1^2) \) we denote the \( L^2 \) space of functions with the inner product

\[
(f, g)_{L^2(D, \varphi_1^2)} = \int_D f(x) g(x) \varphi_1^2(x) \, dx.
\]

**Theorem 1.1.** We have

\[
\lambda_2 - \lambda_1 = \inf_{f \in \mathcal{F}} \frac{A_{d, -\alpha}}{2} \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^{d+\alpha}} \varphi_1(x) \varphi_1(y) \, dx \, dy,
\] (1.7)

where

\[
\mathcal{F} = \{ f \in L^2(D, \varphi_1^2) : \int_D f^2(x) \varphi_1^2(x) \, dx = 1, \quad \int_D f(x) \varphi_1^2(x) \, dx = 0 \}
\]

and \( A_{d, -\alpha} \) is given by (1.4). Moreover the infimum is achieved for \( f = \varphi_2 / \varphi_1 \).

The idea of the proof is based on considering a new semigroup \( \{ T^D_t \}_{t \geq 0} \) of the stable process conditioned to remain forever in \( D \). The proof of Theorem 1.1 is in Section 2.

In the classical case, for Brownian motion, when a dimension is greater than one, the simplest domain where the spectral gap can be explicitly calculated is a rectangle. Let us recall that in this classical case \( \{ \varphi_n \}_{n=1}^\infty, \{ \lambda_n \}_{n=1}^\infty \) are of course eigenfunctions and eigenvalues of Dirichlet Laplacian. Therefore, when (say) \( D = (-a, a) \times (-b, b), a \geq b > 0 \) then

\[
\varphi_1(x_1, x_2) = (1/\sqrt{2ab}) \cos(\pi x_1/(2a)) \cos(\pi x_2/(2b)) \),
\]

\[
\varphi_2(x_1, x_2) = (1/\sqrt{2ab}) \sin(2\pi x_1/(2a)) \cos(\pi x_2/(2b)) \),
\]

\[
\lambda_1 = \pi^2/(4a^2) + \pi^2/(4b^2), \quad \lambda_2 = 4\pi^2/(4a^2) + \pi^2/(4b^2) \text{ and hence } \lambda_2 - \lambda_1 = 3\pi^2/(4a^2) \).
\]

The generator of the symmetric \( \alpha \)-stable process \( \alpha \in (0, 2) \) is a pseudodifferential operator \( -(-\Delta)^{\alpha/2} \) and we are not able to calculate explicitly \( \varphi_n \) \( \lambda_n \) for any domain even an interval or a rectangle. However, when \( D \) is a rectangle, due to simple geometric properties of this set it is shown ([5] Theorem 1.1) that the first eigenfunction \( \varphi_1 \) for any \( \alpha \in (0, 2) \) is ”midconcave”
and unimodal according to the lines parallel to the sides. This property and Theorem 1.1 enables us to obtain sharp upper and lower bound estimates of the spectral gap for all $\alpha \in (0, 2)$. The most complicated are lower bound estimates for $\alpha \in (1, 2)$ and $\alpha = 1$. The main idea of the proof in these cases is contained in Lemmas 4.2 and 4.3.

Below we present estimates of $\lambda_2 - \lambda_1$ for rectangles. The proof of this theorem is in Section 4. Let us point out that these estimates are sharp i.e. the upper and lower bound estimates have the same dependence on the length of the sides of the rectangle (see Remark 1.3 b). Nevertheless, the numerical constants which appear in this theorem are far from being optimal.

**Theorem 1.2.** Let $D = (-L, L) \times (-1, 1)$, where $L \geq 1$. Then

(a) We have

$$2A_{2, -\alpha}^{-1}(\lambda_2 - \lambda_1) \leq 10^6 \cdot \begin{cases} \frac{2}{1 - \alpha} \frac{1}{L^{1+\alpha}} & \text{for } \alpha < 1, \\ 2 \log(L + 1) & \text{for } \alpha = 1, \\ \frac{1}{2 - \alpha} + \frac{1}{\alpha - 1} \frac{1}{L^2} & \text{for } \alpha > 1. \end{cases}$$

(b) We have

$$2A_{2, -\alpha}^{-1}(\lambda_2 - \lambda_1) \geq \begin{cases} \frac{1}{36 \cdot 2^\alpha (L + 1)^{1+\alpha}} & \text{for } \alpha < 1, \\ 10^{-9} \frac{\log(L + 1)}{L^2} & \text{for } \alpha = 1, \\ \frac{1}{33 \cdot 13^{1+\alpha/2} \cdot 10^4} \frac{1}{L^2} & \text{for } \alpha > 1. \end{cases} \quad (1.8)$$

**Remark 1.3.** (a) The inequality

$$2A_{2, -\alpha}^{-1}(\lambda_2 - \lambda_1) \geq \frac{1}{36 \cdot 2^\alpha (L + 1)^{1+\alpha}}$$

is valid for all $\alpha \in (0, 2)$.

We have $2A_{2, -\alpha}^{-1} = \alpha^{-2} 2^{3-\alpha} \Gamma^{-1}(\alpha/2) \Gamma(1 - \alpha/2)$. In particular we get for example $\lambda_2 - \lambda_1 \geq \frac{8}{10^4 (L+1)^{3/2}}$ for $\alpha = 1/2$, $\lambda_2 - \lambda_1 \geq \frac{1}{10^4 (L+1)^{3/2}}$ for $\alpha = 1$, $\lambda_2 - \lambda_1 \geq \frac{8}{10^4 (L+1)^{3/2}}$ for $\alpha = 3/2$. 

5
(b) By scaling we have for $\beta > 0$

$$\lambda_n(\beta D) = \beta^{-\alpha} \lambda_n(D),$$

thus if $D = (-a, a) \times (-b, b)$, where $a \geq b > 0$, then

$$\lambda_2 - \lambda_1 \approx \begin{cases} \frac{b}{a^{1+\alpha}} & \text{for } \alpha < 1, \\ \frac{b}{a^2} \log\left(\frac{a}{b} + 1\right) & \text{for } \alpha = 1, \\ \frac{b^{2-\alpha}}{a^2} & \text{for } \alpha > 1. \end{cases}$$

Our next aim are lower bound estimates of the spectral gap for convex planar domains which are symmetric with respect to both coordinate axes.

In the classical case, for the Brownian motion, there are known sharp estimates for all bounded convex domains $D \subset \mathbb{R}^d$. We have $\lambda_2 - \lambda_1 > \pi^2/d_D^2$ where $d_D$ is the diameter of $D$ see e.g. [24], [27]. Such results are obtained using the fact that the first eigenfunction is log-concave. For convex planar domains which are symmetric with respect to both coordinate axes even better estimates $\lambda_2 - \lambda_1 > 3\pi^2/d_D^2$ are known, see [17], [7] (such estimates are optimal, the lower bound is approached by this rectangles). These results follow from ratio inequalities for heat kernels.

Unfortunately in the case of symmetric $\alpha$-stable processes, $\alpha \in (0, 2)$, we do not know whether the first eigenfunction is log-concave. Instead we use some of the ideas from [4] where spectral gap estimates for the Cauchy process i.e. $\alpha = 1$ were obtained. Namely, we use the fact that the first eigenfunction is unimodal according to the lines parallel to coordinate axes and that it satisfies the appropriate Harnack inequality. Then we use similar techniques as for rectangles. As before in this proof the crucial role have Lemmas 4.2 and 4.3.

The properties of the first eigenfunction are obtained in Section 3 and the proof of lower bound estimates for the spectral gap is in Section 5. These estimates we present below in Theorem 1.4. Let us point out that these estimates are sharp only for $\alpha > 1$, where we know that they cannot be improved because of the results for rectangles.

**Theorem 1.4.** Let $D \subset \mathbb{R}^2$ be a bounded convex domain which is symmetric relative to both coordinate axes. Assume that $[-L, L] \times [-1, 1]$, $L \geq 1$ is the smallest rectangle (with sides parallel to the coordinate axes) containing $D$. Then we have

$$2A_{2,-\alpha}^{-1}(\lambda_2 - \lambda_1) \geq \frac{C}{L^2}.$$
where
\[
C = C(\alpha) = 10^{-93(\alpha - 1)^2 - 2}\left(4 + \frac{12\Gamma(2/\alpha)}{\alpha(2 - \alpha)(1 - 2\alpha/\alpha)}\right)^{-2}.
\]

As for rectangles, using scaling of \(\lambda_n\), one can obtain estimate for domains \(D\) such that \((-a,a) \times (-b,b), a \geq b > 0\) is the smallest rectangle containing \(D\) (cf. Remark 1.3 b).

There are still many open problems concerning the spectral gap for semigroups of symmetric stable processes \(\alpha \in (0, 2)\) in bounded domains \(D \subset \mathbb{R}^d\). Perhaps the most interesting is the following. What is the best possible lower bound estimate for the spectral gap for arbitrary bounded convex domain \(D \subset \mathbb{R}^d\)? With this problem there are connected questions about the shape of the first eigenfunction \(\varphi_1\). For example, is \(\varphi_1\) log-concave or at least unimodal when \(D\) is a convex bounded domain? There is also an unsolved problem concerning domains from Theorem 1.4. Can one obtain for \(\alpha \leq 1\) lower bounds similar to those obtained for rectangles i.e. \(\lambda_2 - \lambda_1 \geq C\alpha/L^{1+\alpha}\) for \(\alpha < 1\) and \(\lambda_2 - \lambda_1 \geq C\log(1 + L)/L^2\) for \(\alpha = 1\)?

2 Variational formula

In this section we prove Theorem 1.1 – the variational formula for the spectral gap.

At first we need the following simple properties of the kernel \(p_D(t,x,y)\).

**Lemma 2.1.** There exists a constant \(c = c(d, \alpha)\) such that for any \(t > 0\), \(x,y \in D\) we have

\[
p_D(t,x,y) \leq p(t,x,y) \leq \frac{ct}{|x-y|^{d+\alpha}}.
\]

For any \(x,y \in D\), \(x \neq y\) we have

\[
\lim_{t \to 0^+} \frac{p_D(t,x,y)}{t} = \lim_{t \to 0^+} \frac{p(t,x,y)}{t} = \frac{\mathcal{A}_{d,-\alpha}}{|x-y|^{d+\alpha}}.
\]

**Proof.** These properties of \(p_D(t,x,y)\) are rather well known. We recall some of the standard arguments.

The estimate \(p(t,x,y) \leq ct|x-y|^{-d-\alpha}\) follows e.g. from the scaling property \(p(t,x,y) = t^{-d/\alpha}p_1((x-y)t^{-1/\alpha})\) and the inequality \(p_1(z) \leq c|z|^{-d-\alpha}\) [29]. The equality on the right-hand side of (2.2) is well known (see (1.3)).

We know that \(p_D(t,x,y) = p(t,x,y) - r_D(t,x,y)\) where

\[
r_D(t,x,y) = E^x(\tau_D < t; p(t - \tau_D, X(\tau_D), y)).
\]
By (2.1) we get for $x, y \in D, t > 0$

$$
\frac{1}{t} r_D(t, x, y) = \frac{1}{t} E^x(\tau_D < t; p(t - \tau_D, X(\tau_D), y)) \\
\leq \frac{1}{t} E^x(\tau_D < t; \frac{ct}{|y - X(\tau_D)|^{d+\alpha}}) \\
\leq \frac{cP^x(\tau_D < t)}{(\delta_D(y))^{d+\alpha}},
$$

where $\delta_D(y) = \inf\{|z - y| : z \in \partial D\}$. It follows that $t^{-1}r_D(t, x, y) \to 0$ when $t \to 0^+$. \hfill \Box

Let

$$
\tilde{p}_D(t, x, y) = \frac{e^{\lambda t} p_D(t, x, y)}{\varphi_1(x)\varphi_1(y)}, \quad x, y \in D, \quad t > 0
$$

and

$$
T_t^D f(x) = \int_D \tilde{p}_D(t, x, y)f(y)\varphi_1^2(y) dy, \quad f \in L^2(D, \varphi_1^2), \quad t > 0.
$$

\{T_t^D\}_{t \geq 0} is a semigroup in $L^2(D, \varphi_1^2)$. This is the semigroup for the stable process conditioned to remain forever in $D$ (see [27] where the same semigroup is defined for Brownian motion).

Let

$$
E(f, f) = \lim_{t \to 0^+} \frac{1}{t} (f - T_t^D f, f)_{L^2(D, \varphi_1^2)},
$$

for $f \in L^2(D, \varphi_1^2)$.

**Lemma 2.2.** For any $f \in L^2(D, \varphi_1^2)$ $E(f, f)$ is well defined and we have

$$
E(f, f) = \frac{A_{d,-\alpha}}{2} \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^{d+\alpha}} \varphi_1(x)\varphi_1(y) dx dy. \tag{2.3}
$$

**Proof.**

$$
E(f, f) = \lim_{t \to 0^+} \frac{1}{t} (f - T_t^D f, f)_{L^2(D, \varphi_1^2)}
= \lim_{t \to 0^+} \frac{1}{t} \int_D \left( f(x) - \int_D e^{\lambda t} p_D(t, x, y) f(y)\varphi_1^2(y) dy \right) f(x)\varphi_1^2(x) dx
= \lim_{t \to 0^+} \frac{1}{t} \int_D \left( f(x)\varphi_1(x) - e^{\lambda t} \int_D p_D(t, x, y) f(y)\varphi_1(y) dy \right) f(x)\varphi_1(x) dx \tag{2.4}
\times f(x)\varphi_1(x) dx.
$$
Note that
\[ f(x)\varphi_1(x) = f(x)e^{\lambda_1 t}P_t^D\varphi_1(x) = e^{\lambda_1 t}\int_D p_D(t, x, y)f(x)\varphi_1(y)\,dy. \]

Hence (2.4) is equal to
\[
\lim_{t \to 0^+} \frac{1}{t} \int_D e^{\lambda_1 t} \int_D p_D(t, x, y) (f(x)\varphi_1(y) - f(y)\varphi_1(y))\,dy f(x)\varphi_1(x)\,dx = \lim_{t \to 0^+} e^{\lambda_1 t} \int_D \int_D \frac{p_D(t, x, y)}{t} (f^2(x) - f(x)f(y))\varphi_1(x)\varphi_1(y)\,dy\,dx. \tag{2.5}
\]

Note that we can interchange the role of \(x\) and \(y\) in (2.5). Therefore by standard arguments (2.5) is equal to
\[
\lim_{t \to 0^+} e^{\lambda_1 t} \frac{1}{2} \int_D \int_D \frac{p_D(t, x, y)}{t} (f(x) - f(y))^2\varphi_1(x)\varphi_1(y)\,dx\,dy. \tag{2.6}
\]

In view of (2.2) in order to prove (2.3) we need only to justify the interchange of the limit and the integral in (2.6). Let us denote
\[
\mathcal{E}_1(f, f) = \int_D \int_D (f(x) - f(y))^2\frac{\varphi_1(x)\varphi_1(y)}{|x - y|^{d+\alpha}}\,dx\,dy.
\]

When \(\mathcal{E}_1(f, f) = \infty\) then (2.3) follows from (2.6) by the Fatou lemma. Now let us consider the case \(\mathcal{E}_1(f, f) < \infty\). By (2.1) for any \(t > 0\) we have
\[
\frac{p_D(t, x, y)}{t} (f(x) - f(y))^2\varphi_1(x)\varphi_1(y) \leq \frac{c(f(x) - f(y))^2}{|x - y|^{d+\alpha}}\varphi_1(x)\varphi_1(y). \tag{2.7}
\]

The integral over \(D \times D\) of the right-hand side of (2.7) is equal to \(c\mathcal{E}_1(f, f) < \infty\). Now (2.3) follows from (2.6) by the bounded convergence theorem.

\[\square\]

**Proof of Theorem 1.1.** Let \(f \in \mathcal{F}\). We have \(f\varphi_1 \in L^2(D)\), 
\[||f\varphi_1||_{L^2(D)} = 1\]
and \(f\varphi_1 \perp \varphi_1\) in \(L^2(D)\). Since \(\{\varphi_n\}_{n=1}^\infty\) is an orthonormal basis in \(L^2(D)\) we have
\[f\varphi_1 = \sum_{n=2}^\infty c_n\varphi_n,\]
where \(c_n = \int_D f(x)\varphi_1(x)\varphi_n(x)\,dx\) and the equality holds in \(L^2(D)\) sense. Hence
\[
f = \sum_{n=2}^\infty c_n\frac{\varphi_n}{\varphi_1}.
\]
in $L^2(D, \varphi_1^2)$ sense. The condition $||f \varphi_1||_{L^2(D)} = 1$ gives $\sum_{n=1}^{\infty} c_n^2 = 1$.

We will show that

$$\mathcal{E}(f, f) = \sum_{n=2}^{\infty} (\lambda_n - \lambda_1) c_n^2. \quad (2.8)$$

Let $f_k = \sum_{n=2}^{k} c_n \varphi_n / \varphi_1$. We have

$$T_t^D f_k(x) = \int_D e^{\lambda_1 t} p_D(t, x, y) \sum_{n=2}^{k} c_n \frac{\varphi_n(y)}{\varphi_1(y)} \varphi_1^2(y) \, dy$$

$$= \frac{e^{\lambda_1 t}}{\varphi_1(x)} \sum_{n=2}^{k} c_n \int_D p_D(t, x, y) \varphi_n(y) \, dy$$

$$= \sum_{n=2}^{k} c_n e^{- (\lambda_n - \lambda_1) t} \frac{\varphi_n(x)}{\varphi_1(x)}.$$

Hence

$$(T_t^D f_k, f_k)_{L^2(D, \varphi_1^2)} = \int_D T_t^D f_k(x) f_k(x) \varphi_1^2(x) \, dx$$

$$= \sum_{n=2}^{k} \sum_{m=2}^{k} c_n c_m e^{- (\lambda_n - \lambda_1) t} \int_D \varphi_n(x) \varphi_m(x) \, dx$$

$$= \sum_{n=2}^{k} c_n^2 e^{- (\lambda_n - \lambda_1) t}.$$

So we obtain

$$(f_k - T_t^D f_k, f_k)_{L^2(D, \varphi_1^2)} = \sum_{n=2}^{k} c_n^2 (1 - e^{- (\lambda_n - \lambda_1) t}).$$

It follows that

$$(f - T_t^D f, f)_{L^2(D, \varphi_1^2)} = \lim_{k \to \infty} (f_k - T_t^D f_k, f_k)_{L^2(D, \varphi_1^2)}$$

$$= \sum_{n=2}^{\infty} c_n^2 (1 - e^{- (\lambda_n - \lambda_1) t}).$$

So

$$\mathcal{E}(f, f) = \lim_{t \to 0^+} \sum_{n=2}^{\infty} c_n^2 \frac{1 - e^{- (\lambda_n - \lambda_1) t}}{t}. \quad (2.9)$$
To show (2.8) we have to justify the change of the limit and the sum in (2.9). Note that \((1 - e^{-(\lambda_n - \lambda_1)t})/t \uparrow \lambda_n - \lambda_1\) when \(t \downarrow 0\) by convexity of the exponential function. Hence (2.8) follows from (2.9) by the monotone convergence theorem.

By (2.8) we get

\[
\mathcal{E}(f, f) = \sum_{n=2}^{\infty} (\lambda_n - \lambda_1)c_n^2 \geq (\lambda_2 - \lambda_1) \sum_{n=2}^{\infty} c_n^2 = \lambda_2 - \lambda_1.
\]

Now Lemma 2.2 shows that the infimum in (1.7) is bigger or equal to \(\lambda_2 - \lambda_1\). When we put \(f = \varphi_2/\varphi_1\) \((c_2 = 1, c_n = 0\) for \(n \geq 3\)) we obtain \(\mathcal{E}(\varphi_2/\varphi_1, \varphi_2/\varphi_1) = \lambda_2 - \lambda_1\). This shows that the infimum in (1.7) is equal to \(\lambda_2 - \lambda_1\) and is achieved for \(f = \varphi_2/\varphi_1\). \(\square\)

### 3 Geometric and Analytic Properties of \(\varphi_1\)

At first we recall the result which is already proven in [4], Theorem 2.1. (Theorem 2.1 in [4] was formulated for \(\alpha = 1\) (the Cauchy process) but the proof works for all \(\alpha \in (0, 2]\).)

**Theorem 3.1.** Let \(D \subset \mathbb{R}^2\) be a bounded convex domain which is symmetric relative to both coordinate axes. Then we have

(i) \(\varphi_1\) is continuous and strictly positive in \(D\).

(ii) \(\varphi_1\) is symmetric in \(D\) with respect to both coordinate axes. That is, \(\varphi_1(x_1, -x_2) = \varphi_1(x_1, x_2)\) and \(\varphi_1(-x_1, x_2) = \varphi_1(x_1, x_2)\).

(iii) \(\varphi_1\) is unimodal in \(D\) with respect to both coordinate axes. That is, if we take any \(a_1 \in (-1, 1)\) and \(p(a_2) > 0\) such that \((p(a_2), a_2) \in \partial D\), then the function \(v(x_1) = \varphi_1(x_1, a_2)\) defined on \((-p(a_2), p(a_2))\) is non-decreasing on \((-p(a_2), 0)\) and non-increasing on \((0, p(a_2))\). Similarly, if we take any \(a_1 \in (-L, L)\) and \(r(a_1) > 0\) such that \((a_1, r(a_1)) \in \partial D\), then the function \(u(x_2) = \varphi_1(a_1, x_2)\) defined on \((-r(a_1), r(a_1))\) is non-decreasing on \((-r(a_1), 0)\) and non-increasing on \((0, r(a_1))\).

Next, we prove the Harnack inequality for \(\varphi_1\). Such inequality is well known (see e.g. Theorem 6.1 in [10]). Our purpose here is to give a proof which will give an explicit constant. We adopt the method from [4].

At first we need to recall some standard facts concerning stable processes.
By $P_{r,x}(z,y)$ we denote the Poisson kernel for the ball $B(x,r) \subset \mathbb{R}^d$, $r > 0$ for the stable process. That is,

$$P^s(X(\tau_{B(x,r)}) \in A) = \int_A P_{r,x}(z,y) \, dy,$$

where $z \in B(x,r)$, $A \subset B^c(x,r)$. We have [9]

$$P_{r,x}(z,y) = C^d_\alpha \frac{(r^2 - |z - x|^2)^{\alpha/2}}{|y - x|^2 - r^2)^{\alpha/2}|y - z|^d}, \quad (3.1)$$

where $C^d_\alpha = \frac{\Gamma(d/2)\pi^{-d/2} \sin(\pi\alpha/2)}{\Gamma(\alpha/2)^2}$. It is well known (see [9]) that

$$E^y(\tau_{B(0,r)}) = C^d_\alpha (\mathcal{A}_{d-\alpha})^{-1}(r^2 - |y|^2)^{\alpha/2}, \quad (3.2)$$

where $r > 0$ and $\mathcal{A}_{d-\alpha}$ is given by (1.4).

When $d > \alpha$ by $G_D(x,y) = \int_0^\infty p_D(t,x,y) \, dt$ we denote the Green function for the domain $D \subset \mathbb{R}^d$, $x,y \in D$. We have $G_D(x,y) < \infty$ for $x \neq y$. (For $d \leq \alpha$ the Green function may be defined by a different formula but we will not use it in this paper).

It is well known (see [9]) that

$$G_{B(0,1)}(z,y) = \frac{R_{d,\alpha}}{|z - y|^{d-\alpha}} \int_0^{w(z,y)} \frac{r^{d-2-1}dr}{(r+1)^{d/2}}, \quad z,y \in B(0,1), \quad (3.3)$$

where

$$w(z,y) = (1 - |z|^2)(1 - |y|^2)/|z - y|^2$$

and $R_{d,\alpha} = \Gamma(d/2)/(2^{\alpha} \pi^{d/2}(\Gamma(\alpha/2))^2)$.

By $\lambda_1(B_1)$ we denote the first eigenvalue for the unit ball $B(0,1)$. Theorem 4 in [6] (cf. also [14]) gives the following estimate of $\lambda_1(B_1)$

$$\lambda_1(B_1) \leq (\mu_1(B_1))^{\alpha/2}, \quad (3.4)$$

where $\mu_1(B_1) \approx 5.784$ is the first eigenvalue of the Dirichlet Laplacian for the unit ball.

We will also need the following easy scaling property of $\varphi_1$.

**Lemma 3.2.** Let $D \subset \mathbb{R}^d$ be a bounded domain, $s > 0$ and $\varphi_{1,s}$ the first eigenfunction on the set $sD$ for the stable semigroup $\{P^{sD}_t\}_{t \geq 0}$. Then for any $x \in D$ we have $\varphi_{1,s}(sx) = s^{-d/2}\varphi_{1,1}(x)$.

Now we can formulate the Harnack inequality for $\varphi_1$. 

12
Theorem 3.3. Let $\alpha \in (0, 2)$, $d > \alpha$ and $D \subset \mathbb{R}^d$ be a bounded domain with inradius $R > 0$ and $0 < a < b < 1$. If $B(x, bR) \subset D$ then on $B(x, aR)$ $\varphi_1$ satisfies the Harnack inequality with constant $C_1 = C_1(d, \alpha, a, b)$. That is, for any $z_1, z_2 \in B(x, aR)$ we have $\varphi_1(z_1) \leq C_1 \varphi_1(z_2)$ where

$$C_1 = \frac{(b + a)^{d-\alpha/2}b^\alpha}{(b - a)^{d+\alpha/2}} \left(1 + e + \frac{b^{d+\alpha/2}C_2}{(b - a)^{\alpha/2}(1 - b^\alpha)d/\alpha}\right)$$

and $C_2 = C_2(d, \alpha) = \alpha^2 2^{3d/2-\alpha/2} C_\alpha d M_{d, \alpha}(\lambda_1(B_1))^{d/\alpha} / ((d - \alpha)R_{d, \alpha} A_{d, -\alpha})$.

Proof of Theorem 3.3. In view of Lemma 3.2 we may and do assume that $R = 1$.

Let $B \subset D$ be any ball ($B \neq D$). For any $x, y \in B$, $t > 0$ we have

$$p_B(t, x, y) = \sum_{n=1}^{\infty} e^{-\lambda_n(B)t} \varphi_n,B(x) \varphi_n,B(y), \quad (3.5)$$

where $\lambda_n(B)$ and $\varphi_n,B$ are the eigenvalues and eigenfunctions for the semigroup $\{P^B_t\}_{t \geq 0}$.

We will use the fact that the first eigenfunction is $q$-harmonic in $B$ according to the $\alpha$-stable Schrödinger operator.

Let $\varphi_1$, $\lambda_1 = \lambda_1(D)$ be the first eigenfunction and eigenvalue for the semigroup $\{P^D_t\}_{t \geq 0}$. Let $A$ be the infinitesimal generator of this semigroup. For $x \in D$ we have

$$A \varphi_1(x) = \lim_{t \to 0^+} \frac{P^D_t \varphi_1(x) - \varphi_1(x)}{t} = \frac{e^{-\lambda_1(D)t} \varphi_1(x) - \varphi_1(x)}{t} = -\lambda_1(D) \varphi_1(x).$$

This gives that $(A + \lambda_1(D)) \varphi_1 = 0$ on $D$. It follows that $\varphi_1$ is $q$-harmonic on $B$ according to the $\alpha$-stable Schrödinger operator $A + q$ with $q \equiv \lambda_1(D)$. Formally this follows from Proposition 3.17, Theorem 5.5, Definition 5.1 from [10] and the fact that $(B, \lambda_1(D))$ is gaugeable because $B$ is a proper open subset of $D$ and $\lambda_1(B) > \lambda_1(D)$.

Let $V_B(x, y) = \int_0^\infty e^{\lambda_1(D)t} p_B(t, x, y) dt$. Here, $V_B$ is the $q$-Green function, for $q \equiv \lambda_1(D)$, see page 58 in [10]. The $q$-harmonicity of $\varphi_1$ (Definition 5.1 in [10]), Theorem 4.10 in [10] (formula (4.15)) and formula (2.17) in [10] (page 61) give that for $z \in B$,

$$\varphi_1(z) = E^z[\epsilon_{\lambda_1(D)}(\tau_B) \varphi_1(X(\tau_B))]$$

$$= A_{d, -\alpha} \int_B V_B(z, y) \int_{D \setminus B} |y - w|^{-d-\alpha} \varphi_1(w) dw dy, \quad (3.6)$$
where \( e_{\lambda_1(D)}(\tau_B) = \exp(\lambda_1(D)\tau_B) \). Of course (3.6) is a standard fact in the theory of \( q \)-harmonic functions for the \( \alpha \)-stable Schrödinger operators. For us this will be a key formula for proving the Harnack inequality for \( \varphi_1 \).

By the well known formula for the distribution of the harmonic measure [22] we have

\[
E^x \varphi_1(X(\tau_B)) = A_{d,-\alpha} \int_B G_B(z, y) \int_{D \backslash B} |y-w|^{-d-\alpha} \varphi_1(w) \, dw \, dy. \quad (3.7)
\]

To obtain our Harnack inequality for \( \varphi_1 \) we will first compare (3.6) and (3.7) and then we will use the formula for \( E^x \varphi_1(X(\tau_B)) \). In order to compare (3.6) and (3.7) we need to compare \( V_B(z, y) \) and \( G_B(z, y) \). This will be done in a sequence of lemmas.

**Lemma 3.4.** Let \( D \subset \mathbb{R}^d \), \( d > \alpha \) be a bounded domain with inradius 1 and \( B \subset D \) be a ball with radius \( b < 1 \). Then for any \( z, y \in B \) and \( t_0 > 0 \) we have

\[
V_B(z, y) \leq e^{\lambda_1(B_1)t_0} \int_0^{t_0} p_B(t, z, y) \, dt + \frac{C_3}{t_0^{(d-\alpha)/\alpha}},
\]

where \( B_1 = B(0, 1) \) and \( C_3 = \alpha(d-\alpha)^{-1}(1-b^\alpha)^{-d/\alpha} M_{d,\alpha} \).

**Proof.** The inradius of \( D \) is 1 so \( \lambda_1(D) \leq \lambda_1(B_1) \). It follows that

\[
V_B(z, y) \leq e^{\lambda_1(B_1)t_0} \int_0^{t_0} p_B(t, z, y) \, dt + \int_{t_0}^{\infty} e^{\lambda_1(B_1)t} p_B(t, z, y) \, dt. \quad (3.8)
\]

By (3.5) we obtain

\[
p_B(t, z, y) = \sum_{n=1}^{\infty} e^{-\lambda_n(B)t} \varphi_{n,B}(z) \varphi_{n,B}(y) \leq \frac{1}{2} \sum_{n=1}^{\infty} e^{-\lambda_n(B)t} (\varphi_{n,B}^2(z) + \varphi_{n,B}^2(y)).
\]

It follows that the second integral in (3.8) is bounded above by

\[
\frac{1}{2} \int_{t_0}^{\infty} \sum_{n=1}^{\infty} e^{(\lambda_1(B_1) - \beta \lambda_n(B))t} e^{-\lambda_n(B)(1-\beta)t} (\varphi_{n,B}^2(z) + \varphi_{n,B}^2(y)) \, dt, \quad (3.9)
\]

where \( \beta = \lambda_1(B_1)/\lambda_1(B) = b^\alpha \) (see 1.9).

Note also that \( e^{\lambda_1(B_1) - \beta \lambda_n(B)} \leq e^{\lambda_1(B_1) - \beta \lambda_1(B)} = e^0 = 1 \).

For any \( w \in B \) (\( w = z \) or \( w = y \)) we have

\[
\int_{t_0}^{\infty} \sum_{n=0}^{\infty} e^{-\lambda_n(B)(1-\beta)t} \varphi_{n,B}^2(w) \, dt = \int_{t_0}^{\infty} p_B((1-\beta)t, w, w) \, dt \\
\leq \int_{t_0}^{\infty} p((1-\beta)t, 0, 0) \, dt \leq \int_{t_0}^{\infty} \frac{M_{d,\alpha}}{(1-\beta)^{d/\alpha} \alpha} \, dt = \frac{C_3}{t_0^{(d-\alpha)/\alpha}}.
\]

\( \square \)
Lemma 3.5. Let $0 < a < b < 1$, $B = B(w, b)$, $w \in \mathbb{R}^d$. For any $y \in B$ and $z \in B(w, a)$ we have

$$C_4 G_B(z, y) \geq E^y(\tau_B),$$

where $C_4 = b^{d+\alpha/2}a^{2d/2-\alpha/2-1}C_d/((b-a)\alpha/2R_{d,\alpha}\mathcal{A}_{d,\alpha}).$

Proof. We may and do assume that $w = 0$. Let us consider the formula for the Green function for a unit ball $G_B(0,1)(z,y)$ (3.3). Note that for any $t > 0$

$$\int_0^t r^{\alpha/2-1}dr \geq \frac{1}{2^{d/2}} \int_0^{t^{\frac{\alpha}{2}} \frac{1}{2^{d/2}}} r^{\alpha/2-1} = \frac{(t^{\alpha/2} \land 1)}{\alpha 2^{d/2-1}}.$$

Hence for any $z,y \in B(0,1)$

$$G_B(0,1)(z,y) \geq R_{d,\alpha} \alpha^{-1}2^{-d/2+1}|z-y|^{\alpha-d}(1 \land (w(z,y))^\alpha/2).$$

By scaling it follows that for any $z,y \in B$,

$$G_B(z, y) = b^{d-a}G_B(0,1) \left( \frac{z}{b}, \frac{y}{b} \right) \geq \frac{R_{d,\alpha} \alpha^{-1}2^{-d/2+1}}{b^{d-a} |\hat{z} - \frac{y}{b}|^{d-a}} \left( 1 \land (1-|\hat{z}|^2)^{\alpha/2} \left( 1 - |\frac{y}{b}|^2 \right)^{\alpha/2} \right)\right) \right) = \frac{R_{d,\alpha} \alpha^{-1}2^{-d/2+1}}{b^{\alpha} |z-y|^{d-a}} \left( b^{\alpha} \land (b^2 - |z|^2)^{\alpha/2}(b^2 - |y|^2)^{\alpha/2} \right) |z-y|^{d-a}. (3.10)$$

For $z \in B(0, a)$ and $y \in B = B(0, b)$ we have $|z-y| \leq a + b \leq 2b$ and $(b^2 - |z|^2)^{\alpha/2} \geq (b^2 - a^2)^{\alpha/2}$. Hence

$$\frac{(b^2 - |z|^2)^{\alpha/2}}{|z-y|^{\alpha}} \geq \frac{((b-a)(b+a))^{\alpha/2}}{(a+b)^{2\alpha/2}} \geq \frac{1}{2^{\alpha/2}} \left( 1 - \frac{a}{b} \right)^{\alpha/2}. \right)$$

It follows that for $z \in B(0, a)$ and $y \in B(0, b)$, (3.10) is bounded below by

$$\frac{R_{d,\alpha} \alpha^{-1}2^{-d/2+1}}{b^{d-a} \alpha^{2\alpha/2}} \left( 1 - \frac{a}{b} \right)^{\alpha/2} (b^2 - |y|^2)^{\alpha/2}. \right)$$

By the formula for $E^y(\tau_B)$ (3.2) this is equal to $C_4^{-1}E^y(\tau_B).$ \hfill \qed

Lemma 3.6. Let $D \subset \mathbb{R}^d$, $d > \alpha$ be a bounded domain with inradius 1, $0 < a < b < 1$ and $B = B(x, b) \subset D$. Then for any $z \in B(x, a)$ and $y \in B$ we have $G_B(z, y) \leq V_B(z, y) \leq C_5 G_B(z, y)$, where $C_5 = 1 + e + C_3C_4(\lambda_1(B_1))^{d/\alpha}$. 

15
Proof. The inequality $G_B(z, y) \leq V_B(z, y)$ is trivial, it follows from the definition of $G_B(z, y)$ and $V_B(z, y)$.

We will prove the inequality $V_B(z, y) \leq C_5 G_B(z, y)$. By Lemma 4.8 in [10] we have

$$V_B(z, y) = G_B(z, y) + \lambda_1(D) \int_B V_B(z, u)G_B(u, y) \, du.$$  \hspace{1cm} (3.11)

By Lemma 3.4, $\int_B V_B(z, u)G_B(u, y) \, du$ is bounded above by

$$e^{\lambda_1(B_1)t_0} \int_B \int_0^{t_0} p_B(t, z, u) dt G_B(u, y) \, du + \frac{C_3}{t_0^{(d-\alpha)/\alpha}} \int_B G_B(u, y) \, du.$$  \hspace{1cm} (3.12)

Let us denote the above sum by I + II. We have

$$\int_B \int_0^{t_0} p_B(t, z, u) dt G_B(u, y) \, du = \int_0^{t_0} \int_0^{\infty} p_B(t, z, u) p_B(s, u, y) \, du \, ds \, dt = \int_0^{t_0} \int_0^{\infty} p_B(t + s, z, y) \, ds \, dt \leq t_0 G_B(z, y).$$

It follows that $I \leq t_0 e^{\lambda_1(B_1)t_0} G_B(z, y)$.

By applying Lemma 3.5 for $z \in B(x, a)$ we get

$$\Pi = \frac{C_3 E^y(\tau_B)}{t_0^{(d-\alpha)/\alpha}} \leq \frac{C_3 C_4 G_B(z, y)}{t_0^{(d-\alpha)/\alpha}}.$$  \hspace{1cm}

Putting the estimates (3.11), (3.12) together with those for I and II gives

$$V_B(z, y) \leq G_B(z, y) \left( 1 + \lambda_1(B_1)t_0 e^{\lambda_1(B_1)t_0} + \frac{C_3 C_4 \lambda_1(B_1)}{t_0^{(d-\alpha)/\alpha}} \right).$$  \hspace{1cm} (3.13)

Putting $t_0 = 1/\lambda_1(B_1)$ we obtain

$$V_B(z, y) \leq G_B(z, y)(1 + e + C_3 C_4 (\lambda_1(B_1))^{d/\alpha}).$$

We now return to the proof of Theorem 3.3. Let $z_1, z_2 \in B(x, a) \subset B(x, b) \subset D$. By (3.6), (3.7) and Lemma 3.6 we obtain

$$\varphi_1(z_2) \geq E^{z_2}[\varphi_1(X(\tau_{B(x,b)})].$$  \hspace{1cm} (3.14)

and

$$\varphi_1(z_1) \leq C_5 E^{z_1}[\varphi_1(X(\tau_{B(x,b)})].$$  \hspace{1cm} (3.15)
So to compare \( \varphi_1(z_2) \) and \( \varphi_1(z_1) \) we have to compare \( E^{z_1}[\varphi_1(X(\tau_{B(x,b)}))] \) and \( E^{z_2}[\varphi_1(X(\tau_{B(x,b)}))] \).

We have

\[
E^{z_i}[\varphi_1(X(\tau_{B(x,b)}))] = \int_{D \setminus B(x,b)} \varphi_1(y)P_{b,x}(z_i, y) \, dy, \tag{3.16}
\]

for \( i = 1, 2 \), where \( P_{b,x}(z_i, y) \) is the Poisson kernel for the ball \( B(x,b) \) which is given by an explicit formula (3.1). We have reduce to comparing \( P_{b,x}(z_1, y) \) and \( P_{b,x}(z_2, y) \). Recall that \( z_1, z_2 \in B(x,a) \). For \( y \in B^c(x,b) \) we have

\[
\frac{|y - z_2|}{|y - z_1|} \leq \frac{b + a}{b - a}
\]

and

\[
\frac{(b^2 - |z_1 - x|^2)^{\alpha/2}}{(b^2 - |z_2 - x|^2)^{\alpha/2}} \leq \frac{b^\alpha}{(b^2 - a^2)^{\alpha/2}}.
\]

It follows that

\[
\frac{P_{b,x}(z_1, y)}{P_{b,x}(z_2, y)} \leq \frac{(b + a)^{d - \alpha/2}b^\alpha}{(b - a)^{d + \alpha/2}}.
\]

Using this, (3.16), (3.15) and (3.14) we obtain for \( z_1, z_2 \in B(x,a) \)

\[
\varphi_1(z_1) \leq C_5 (b + a)^{d - \alpha/2}b^\alpha (b - a)^{-d - \alpha/2} \varphi_1(z_2).
\]

\( \square \)

In this paper we will need the Harnack inequality for \( \varphi_1^2 \) in dimension \( d = 2 \). For this reason we will formulate the following corollary of Theorem 3.3. In this corollary we choose \( b \in (0, 1/2] \) and \( a = b/2 \).

**Corollary 3.7.** Let \( \alpha \in (0, 2) \) and \( D \subset \mathbb{R}^2 \) be a bounded domain with inradius \( R > 0 \) and \( b \in (0, 1/2] \). If \( B(x,bR) \subset D \) then on \( B(x,bR/2) \) \( \varphi_1^2 \) satisfies the Harnack inequality with constant \( c_H = c_H(\alpha) \). That is, for any \( z_1, z_2 \in B(x,bR/2) \) we have \( \varphi_1^2(z_1) \leq c_H \varphi_1^2(z_2) \) where

\[
c_H = 3^{4 - \alpha}2^{2\alpha} \left( 4 + \frac{12\Gamma(2/\alpha)}{\alpha(2 - \alpha)(1 - 2 - \alpha)^2/\alpha} \right)^2. \tag{3.17}
\]

We point out that \( c_H \) does not depend on \( b \in (0, 1/2] \).

**Proof.** We are going to obtain upper bound estimates for constants \( C_1, C_2 \) from Theorem 3.3 for \( d = 2, a = b/2 \) and \( b \in (0, 1/2] \).

Putting \( d = 2 \) we get \( C_2^2 = \pi^{-2}\sin(\pi\alpha/2), R_{2,\alpha} = 2^{-\alpha}\pi^{-1}\Gamma^{-2}(\alpha/2), M_{2,\alpha} = 2^{-\alpha}\pi^{-1}\Gamma(2/\alpha), A_{2,-\alpha} = \alpha^{-2}\pi^{-2}\Gamma(\alpha/2)\Gamma^{-1}(1 - \alpha/2) \).
Putting these constants to the formula for $C_2$ and using also the fact that \( \Gamma(\alpha/2)\Gamma(1 - \alpha/2) = \pi \sin^{-1}(\pi\alpha/2) \) we obtain after easy calculations

\[
C_2 = \frac{2^{3-\alpha/2}\Gamma(2/\alpha)(\lambda_1(B_1))^{2/\alpha}}{(2 - \alpha)\alpha} \leq \frac{6 \cdot 2^{3-\alpha/2}\Gamma(2/\alpha)}{(2 - \alpha)\alpha}.
\]

The last inequality follows from (3.4) and the fact that \( \mu_1(B_1) < 6 \).

Putting \( d = 2 \) and \( a = b/2 \) we obtain

\[
C_1 = 3^{2-\alpha/2}2^\alpha \left(1 + e + \frac{2^{\alpha/2}b^2C_2}{(1 - b^\alpha)^{2/\alpha}}\right).
\]

Now using the estimate for \( C_2 \) and the inequality \( b \leq 1/2 \) we get

\[
C_1 \leq 3^{2-\alpha/2}2^\alpha \left(4 + \frac{12\Gamma(2/\alpha)}{\alpha(2 - \alpha)(1 - 2^{-\alpha})^{2/\alpha}}\right). \tag{3.18}
\]

In the assertion of Corollary 3.7 we have the Harnack inequality for \( \varphi_1^2 \) so \( c_H \) is equal to the square of the right hand side of (3.18). \hfill \Box

4 Spectral gap for rectangles

We begin from several lemmas, which will lead us to the estimation of the spectral gap for rectangles.

Lemma 4.1. Let \( D = (-L, L) \times (-1, 1) \), where \( L \geq 1 \). Then

\[
\varphi_1(x) \leq \frac{3}{\sqrt{L}} \quad \text{for all } x \in D
\]

and

\[
\varphi_1(x_1, x_2) \geq \frac{1}{2\sqrt{L}} (1 - \frac{2}{L}|x_1|)(1 - 2|x_2|)
\]

for all \((x_1, x_2) \in [-L/2, L/2] \times [-1/2, 1/2] \).

Proof. The lemma easily follows from unimodality and symmetry of \( \varphi_1 \) (see Theorem 3.1), midconcavity of \( \varphi_1 \) (see Theorem 1.1 in [5]) and the equality \( \int_D \varphi_1^2 \, dx = 1 \). \hfill \Box

Lemma 4.2. Let \( \mu_k > 0 \) (\( k = 1, \ldots, L \)), \( L \geq 2 \) be unimodal, i.e., there exists \( k_0 \) such that \( \mu_i \leq \mu_j \) for \( i \leq j \leq k_0 \) and \( \mu_i \geq \mu_j \) for \( k_0 \leq i \leq j \). Then for any \( f_k \in \mathbb{R} \) such that \( \sum_{k=1}^{L} \mu_k \mu_k = 0 \) we have

\[
\sum_{k=1}^{L} \mu_k f_k^2 \leq L^2 \sum_{k=1}^{L-1} (\mu_k \wedge \mu_{k+1})(f_k - f_{k+1})^2.
\]
Proof. Let $M = \sum_{k=1}^{L} \mu_k$. By \( \sum_{k=1}^{L} \mu_k f_k = 0 \) and Schwarz inequality we obtain

\[
M \sum_{k=1}^{L} \mu_k f_k^2 = \sum_{j=1}^{L} \mu_j \sum_{k=1}^{L} \mu_k f_k^2 = \frac{1}{2} \sum_{j,k=1}^{L} \mu_j \mu_k (f_j^2 + f_k^2)
\]

\[
= \frac{1}{2} \sum_{j,k=1}^{L} \mu_j \mu_k (f_j - f_k)^2
\]

\[
= \sum_{1 \leq j < k \leq L} \mu_j \mu_k \left( \sum_{t=j}^{k-1} (f_t - f_{t+1}) \right)^2
\]

\[
\leq L \sum_{1 \leq j < k \leq L} \mu_j \mu_k \sum_{t=j}^{k-1} (f_t - f_{t+1})^2
\]

\[
= L \sum_{t=1}^{L-1} \left( \sum_{j \leq t < k} \mu_j \mu_k \right) \cdot (f_t - f_{t+1})^2. \tag{4.1}
\]

For \( t < k_0 \) (where \( k_0 \) is defined in the lemma) we have

\[
\sum_{j \leq t < k} \mu_j \mu_k \leq L \mu_t \sum_{k=1}^{L} \mu_k = L(\mu_t \land \mu_{t+1}) M.
\]

Similarly for \( t \geq k_0 \)

\[
\sum_{j \leq t < k} \mu_j \mu_k \leq L \mu_{t+1} \sum_{j=1}^{L} \mu_j = L(\mu_t \land \mu_{t+1}) M.
\]

These two inequalities combined with (4.1) finish the proof. \( \square \)

Lemma 4.3. Let \((D, \mu)\) be a finite measure space and \( D = \bigcup_{k=1}^{L} D_k \), \( L \geq 1 \) with pairwise disjoint \( D_k \)’s. We assume that the sequence \( \mu_k = \mu(D_k) > 0 \) is unimodal. Then

\[
\frac{1}{\mu(D)} \int_D \int_D (f(x) - f(y))^2 \mu(dx) \mu(dy) \tag{4.2}
\]

\[
\leq 2 \sum_{k=1}^{L} \mu_k \int_{D_k} \int_{D_k} (f(x) - f(y))^2 \mu(dx) \mu(dy) \tag{4.3}
\]

\[
+ 4L^2 \sum_{k=1}^{L-1} \frac{1}{\mu_k \lor \mu_{k+1}} \int_{D_k} \int_{D_{k+1}} (f(x) - f(y))^2 \mu(dx) \mu(dy) \tag{4.4}
\]

for all \( f \in L^2(D, \mu) \).
Proof. Let \( f \in L^2(D, \mu) \). Without loss of generality we may assume that \( L \geq 2 \) and \( \int_D f d\mu = 0 \). Then (4.2) is equal to \( 2 \int_D f^2 d\mu \).

Let \( f_k = \frac{1}{\mu_k} \int_{D_k} f d\mu \). We have

\[
\sum_{k=1}^L \frac{1}{\mu_k} \int_{D_k} \int_{D_k} (f(x) - f(y))^2 \mu(dx) \mu(dy) = 2 \int_D f^2 d\mu - 2 \sum_{k=1}^L \mu_k f_k^2.
\]

Thus if \( \sum_{k=1}^L \mu_k f_k^2 \leq \frac{1}{2} \int_D f^2 d\mu \), then (4.2 - 4.4) holds. Consequently, from now on we may assume that

\[
\sum_{k=1}^L \mu_k f_k^2 > \frac{1}{2} \int_D f^2 d\mu. \tag{4.5}
\]

Thus, by Lemma 4.2 we have

\[
2 \int_D f^2 d\mu < 4L^2 \sum_{k=1}^{L-1} (\mu_k \wedge \mu_{k+1})(f_k - f_{k+1})^2. \tag{4.6}
\]

On the other hand,

\[
\int_{D_k} \int_{D_{k+1}} (f(x) - f(y))^2 \mu(dx) \mu(dy) = \int_{D_k} \int_{D_{k+1}} ((f(x) - f_k) - (f(y) - f_{k+1}) + (f_k - f_{k+1}))^2 \mu(dx) \mu(dy) \geq \mu_k \mu_{k+1} (f_k - f_{k+1})^2.
\]

The lemma now follows from (4.6). \( \square \)

**Lemma 4.4.** Let \( \alpha \in [1, 2] \), \( D = (-L, L) \times (-1, 1) \), \( L \geq 1 \) and \( \varphi_1 \) be the first eigenfunction for \( \{P_t^D\}_{t \geq 0} \). Let \(-L + 1/4 \leq a \leq b \leq L - 1/4\), \( b - a = 1/8 \) and put \( A = [a, b] \times [-1/8, 1/8] \). Then we have

\[
\left( \max_{x \in A} \varphi_1^2(x) \right) \left( \int_A \varphi_1^2(x) \, dx \right)^{-1} \leq C_R, \tag{4.7}
\]

where \( C_R = 10^4 \).

**Proof.** We will use the fact that \( \varphi_1 \) is symmetric and unimodal with respect to both coordinate axes (see Theorem 3.1). We will also use much stronger fact that \( \varphi_1 \) is "midconcave" (see Theorem 1.1 in [5]). That is for any \( x_2 \in (-1, 1) \) \( x_1 \to \varphi_1(x_1, x_2) \) is concave on \((-L/2, L/2)\) and for any \( x_1 \in (-L, L) \) \( x_2 \to \varphi_1(x_1, x_2) \) is concave on \((-1/2, 1/2)\).
By symmetry of \( \varphi_1 \) we may and do assume that \( b \geq 0 \). We will consider two cases: Case 1, \( b \in [0, 3/8) \), Case 2, \( b \in [3/8, L) \).

At first let us consider Case 1: \( b \in [0, 3/8) \). Note that by the unimodality \( \min_{x \in A} \varphi_1(x) \) is equal to \( \varphi_1(b, 1/8) \) or \( \varphi_1(a, 1/8) \). By concavity of \( x_2 \to \varphi_1(b, x_2) \) on \((-1/2, 1/2)\) we obtain

\[
\varphi_1(b, 1/8) \geq (3/4)\varphi_1(b, 0) + (1/4)\varphi_1(b, 1/2) \geq (3/4)\varphi_1(b, 0).
\]

On the other hand \( x_1 \to \varphi_1(x_1, 0) \) is concave on \((-L/2, L/2)\). We have \( L \geq 1 \) so \( x_1 \to \varphi_1(x_1, 0) \) is concave on \((-1/2, 1/2)\). It follows that

\[
\varphi_1(b, 0) \geq \varphi_1(3/8, 0) \geq (1/4)\varphi_1(0, 0) + (3/4)\varphi_1(1/2, 0) \geq (1/4)\varphi_1(0, 0).
\]

Hence \( \varphi_1(b, 1/8) \geq (3/16)\varphi_1(0, 0) \). Similarly one can show that \( \varphi_1(a, 1/8) \geq (3/16)\varphi_1(0, 0) \).

We also have \( \max_{x \in D} \varphi_1(x) = \varphi_1(0, 0) \geq \max_{x \in A} \varphi_1(x) \). Finally

\[
\int_A \varphi_1^2(x) \, dx \geq |A| \min_{x \in A} \varphi_1^2(x) \geq \frac{1}{32} \left( \frac{3}{16} \right) \varphi_1^2(0, 0) \geq \frac{9}{213} \max_{x \in A} \varphi_1^2(x).
\]

This gives (4.7) and finishes Case 1.

Now let us consider Case 2: \( b \in [3/8, L) \). Note that \( \max_{x \in A} \varphi_1(x) = \varphi_1(a, 0) \) and \( \min_{x \in A} \varphi_1(x) = \varphi_1(b, 1/8) \). As before \( \varphi_1(b, 1/8) \geq (3/4)\varphi_1(b, 0) \).

Hence

\[
\int_A \varphi_1^2(x) \, dx \geq |A| \left( \frac{3}{4} \right)^2 \varphi_1^2(b, 0) = \frac{9}{25} \varphi_1^2(b, 0).
\]  

(4.8)

Now we have to estimate \( \varphi_1(b, 0) \).

Let \( x_0 = (b, 0) \), \( r = \sqrt{2}/8 \) and consider a ball \( B = B(x_0, r) \). It is easy to note that \( \overline{B} \subset D \). By formula (3.6) and the fact that \( e_{\lambda_1(D)}(\tau_B) \geq 1 \) we have

\[
\varphi_1(x_0) \geq E^{x_0}[\varphi_1(X(\tau_B))].
\]  

(4.9)

Now let us introduce polar coordinates \((\rho, \psi)\) with centre at \( x_0 = (b, 0) \). For any \( z = (z_1, z_2) \in \mathbb{R}^2 \) we have \( z_1 - b = \rho \cos(\psi), \; z_2 = \rho \sin(\psi) \). Let us consider the set \( S_1 = \{(\rho, \psi) : \rho \in (r, 2r), \; \psi \in (3\pi/4, 5\pi/4)\} \). Note that \( S_1 \) is chosen so that \( S_1 \subset [b-2r, b-r/\sqrt{2}] \times [-\sqrt{2}r, \sqrt{2}r] \subset [b-3/8, a] \times [-1/4, 1/4] \).

By unimodality and ”midconcavity” for any \( z \in [b-3/8, a] \times [-1/4, 1/4] \) we have \( \varphi_1(z) \geq \varphi_1(a, 0)/2 \). This and (4.9) gives

\[
\varphi_1(x_0) \geq E^{x_0}[\varphi_1(X(\tau_B))]; \; X(\tau_B) \in S_1 \geq (\varphi_1(a, 0)/2)P^{x_0}(X(\tau_B) \in S_1).
\]  

(4.10)

We have

\[
P^{x_0}(X(\tau_B) \in S_1) = \int_{S_1} P_{r,x_0}(x_0, y) \, dy,
\]  

21
where \( P_{r,x_0}(x_0,y) \) is the Poisson kernel for \( B \) given by (3.1).

Let \( S_2 = \{ (\rho, \psi) : \rho \in (2r, \infty), \psi \in (3\pi/4, 5\pi/4) \} \). Since \( P^{x_0}(X(\tau_B) \in B^c) = 1 \) and the distribution \( P^{x_0}(X(\tau_B) \in \cdot) \) is invariant under rotation around \( x_0 \) it is easy to note that \( P^{x_0}(X(\tau_B) \in S_1 \cup S_2) = 1/4 \). Hence

\[
P^{x_0}(X(\tau_B) \in S_1) = \frac{1}{4} - P^{x_0}(X(\tau_B) \in S_2) = \frac{1}{4} - \int_{S_2} P_{r,x_0}(x_0,y) \, dy. \tag{4.11}
\]

We have

\[
\int_{S_2} P_{r,x_0}(x_0,y) \, dy = C_2^2 \int_{3\pi/4}^{5\pi/4} \int_{2r}^\infty \frac{\rho^\alpha}{\rho^\alpha - \rho^2} \rho \, d\rho \, d\psi. \tag{4.12}
\]

Note that \( \rho^2 - \rho^2 \geq (3/4)\rho^2 \) for \( \rho \geq 2r \) so (4.12) is smaller than

\[
C_2^2 \pi r \alpha \int_{3\pi/4}^{5\pi/4} \int_{2r}^\infty \frac{\rho^\alpha}{\rho^\alpha - \rho^2} \rho \, d\rho \, d\psi \leq \frac{1}{2\pi \alpha^3/2} \sin \left( \frac{\pi \alpha}{2} \right) \leq \frac{1}{2\pi \sqrt{3}}.
\]

The last inequality follows from the fact that in this lemma we assume that \( \alpha \in [1,2) \).

Using this, (4.10) and (4.11) we obtain

\[
\varphi_1(x_0) \geq \frac{\varphi_1(a,0)}{2} \left( 1 - \frac{1}{2\pi \sqrt{3}} \right).
\]

This and (4.8) gives

\[
\int_A \varphi_1^2(x) \, dx \geq \frac{9}{2^9} \left( \frac{1}{2} - \frac{1}{2\pi \sqrt{3}} \right)^2 \frac{\varphi_1^2(a,0)}{10^4} = C_R^{-1} \max_{x \in A} \varphi_1^2(x).
\]

\[ \square \]

**Proof of Theorem 1.2 – part I.** Let us take \( f(x_1,x_2) = x_1 \) for \( x = (x_1,x_2) \in D \). Then by Lemma 4.1

\[
\int_D f^2 \varphi_1^2 \, dx \geq \frac{1}{4L} \int_{-L/2}^{L/2} \int_{-L/2}^{L/2} (1 - \frac{2}{L}|x_1|)^2(1 - 2|x_2|)^2 x_1^2 x_2^2 \, dx_1 \, dx_2
\]

\[
= \frac{L^2}{1440}.
\]

On the other hand, for \( x \in D \) we have

\[
\int_D |x - y|^{-\alpha} \, dy \leq \int_{B(0,\sqrt{5})} |y|^{-\alpha} \, dy
\]

\[
+ \int_{-L}^{L} \int_{-1}^{1} (|x_1 - y_1|^2 + |x_2 - y_2|^2)^{-\alpha/2} 1_{R \setminus [-1,1]}(y_1) \, dy_2 \, dy_1
\]

\[
\leq 2\pi \frac{5^{1-\alpha/2}}{2 - \alpha} + 4 \int_{1}^{L} y_1^{-\alpha} \, dy_1.
\]

22
Thus by Lemma 4.1
\[ E(f, f) < \frac{A_{2-\alpha}}{2} 9 \cdot 4L \cdot (2\pi \frac{5^{1-\alpha/2}}{2 - \alpha} + 4 \int_1^L y_1^{-\alpha} dy_1). \]

Hence by Theorem 1.1
\[ \lambda_2 - \lambda_1 \leq \frac{E(f, f)}{\int_D f^2 \phi_1^2 dx} \leq \frac{A_{2-\alpha}}{2} 72 \cdot 1440 \left( \frac{5^{1-\alpha/2}}{2 - \alpha} + 2 \int_1^L y_1^{-\alpha} dy_1 \right), \]

therefore part (a) is proven.

For \( f \in L^2(D, \phi_1^2) \) such that \( \int_D f \phi_1^2 dx = 0 \) we have by Lemma 4.1
\[
\int_D f^2 \phi_1^2 dx = \frac{1}{2} \int_D \int_D (f(x) - f(y))^2 \phi_1^2(x) \phi_1^2(y) dx dy \\
\leq \frac{9 \text{ diam}(D)^{2+\alpha}}{2L} \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^{2+\alpha}} \phi_1(x) \phi_1(y) dx dy \\
\leq 36 \cdot 2^\alpha (L + 1)^{1+\alpha} \frac{2}{A_{2-\alpha}} E(f, f),
\]

thus by Theorem 1.1 we obtain Remark 1.3(a) and also (1.8) in the case when \( \alpha < 1 \).

Let \( D = \bigcup_{k=1}^{2L} D_k \) be divided into \([2L]\) pairwise disjoint rectangles \( D_k \) of size \( \frac{2L}{(2L)^2} \times 2 \), denote \( E_k = D_k \cup D_{k+1} \). Let \( \mu = \phi_1^2 dx \), by Theorem 3.1 we see that \( (D, \mu) \) satisfies the assumptions of Lemma 4.3. Thus for \( f \in L^2(D, \phi_1^2) \) such that \( \int_D f \phi_1^2 dx = 0 \) we have
\[
2 \int_D f^2 \phi_1^2 dx \leq 2 \sum_{k=1}^{2L} \frac{1}{D_k} \varphi_1^2 dx \int_{D_k} \int_{D_k} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) dx dy \\
+ 4 [2L]^2 \sum_{k=1}^{[2L]-1} \frac{2}{E_k} \varphi_1^2 dx \int_{E_k} \int_{E_k} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) dx dy \\
= I_1 + I_2,
\]

\[
I_2 \leq 32L^2 \sum_{k=1}^{[2L]-1} \sup_{E_k} \varphi_1^2 \frac{\text{diam}(E_k)^{2+\alpha}}{2L} \int_{E_k} \int_{E_k} (f(x) - f(y))^2 \frac{\text{diam}(E_k)^{2+\alpha}}{|x - y|^{2+\alpha}} \varphi_1(x) \varphi_1(y) dx dy.
\]
Hence by Lemma 4.4 and \( \text{diam}(E_k) \leq \sqrt{13} \) we obtain

\[
I_2 \leq 64 \cdot 13^{1+\alpha/2} C_R L^2 \frac{2}{A_{2,-\alpha}} \mathcal{E}(f,f).
\]

Similarly,

\[
I_1 \leq 2 \cdot 13^{1+\alpha/2} C_R \frac{2}{A_{2,-\alpha}} \mathcal{E}(f,f)
\]

and (1.8) in the case when \( \alpha > 1 \) follows.

Proof of Theorem 1.2 – part II, the case \( \alpha = 1 \).

Let \( N = \lfloor L \rceil \). We divide \( D \) into \( 2N \) rectangles of equal size \( D_{-N+1}, \ldots, D_N \), where

\[
D_k = ((k-1)L/N, kL/N) \times (-1,1), \quad k = -N+1, \ldots, N.
\]

Let us note that Lemma 4.4 implies

\[
\left( \sup_{x \in D_k} \varphi_1^2 \right) \left( \int_{D_k} \varphi_1^2 \right)^{-1} \leq C_1^{-1},
\]

where \( C_1 = C_{R-1} = 10^{-4} \).

We will also use the following easy inequality

\[
\inf_{x \in D_k, y \in D_{k+1}} |x-y|^{-3} \geq C_2,
\]

where \( C_2 = (\sqrt{20})^{-3} \).

In the case \( \alpha = 1 \) we will show that

\[
2 A_{2,-1}^{-1} (\lambda_2 - \lambda_1) \geq \frac{C_1 C_2 \log (L + 1)}{360 L^2}.
\]

(4.13)

This implies (1.8) in the remaining case when \( \alpha = 1 \).

Fix \( i \in \{1, \ldots, N\} \). For any \( k = 1, \ldots, i \) let

\[
A_k^i = \ldots \cup D_{k-2i} \cup D_{k-i} \cup D_k \cup D_{k+i} \cup D_{k+2i} \cup \ldots
\]

Since \( N \) is not necessarily divisible by \( i \) the number of “parts” of \( A_k^i \) may not be equal for different \( k \). To make the definition of \( A_k^i \) more precise we introduce some more notation.

We have \( N = i[N/i] + r(i) \) for some \( r(i) \in \{0, \ldots, i-1\} \). Let \( q(i,k) = [N/i] \) for \( k = 1, \ldots, r(i) \), \( q(i,k) = [N/i] - 1 \) for \( k = r(i)+1, \ldots, i \) and \( p(i,k) = -[N/i] \) for \( k = 1, \ldots, i-r(i) \), \( p(i,k) = -[N/i] - 1 \) for \( k = i-r(i)+1, \ldots, i \).

For \( m = p(i,k), \ldots, q(i,k) \) let \( D_{k,m} = D_{k+mi} \). Then we have

\[
A_k^i = \bigcup_{m=p(i,k)}^{q(i,k)} D_{k,m}^i.
\]

24
Now we will apply Lemma 4.1 to the set \( A^i_k \) which is divided as above. We take \( \mu(dx) = \varphi_1^2(x) \) \( dx \) and \( f = \varphi_2/\varphi_1 \). Let us denote \( \mu_{k,m}^i = \int_{D_{k,m}^i} \varphi_1^2 \).

Of course we have \( \mu_{k,m}^i \vee \mu_{k,m+1}^i \geq (\mu_{k,m}^i \mu_{k,m+1}^i)^{1/2} \) and

\[
\int_{A_k^i} \int_{A_k^i} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy = 2 \int_{A_k^i} f^2 \varphi_1^2 \int_{A_k^i} \varphi_1^2 - 2 \left( \int_{A_k^i} f \varphi_1^2 \right)^2.
\]

So applying Lemma 4.1 to \( A_k^i \) and summing from \( k = 1 \) to \( k = i \) we obtain

\[
2 \sum_{k=1}^{i} \int_{A_k^i} f^2 \varphi_1^2 - 2 \sum_{k=1}^{i} \left( \int_{A_k^i} \varphi_1^2 \right)^{-1} \left( \int_{A_k^i} f \varphi_1^2 \right)^2 \leq (4.14)
\]

\[
2 \sum_{k=1}^{i} \sum_{m=p(i,k)}^{q(i,k)} \frac{1}{\mu_{k,m}^i} \int_{D_{k,m}^i} \int_{D_{k,m}^i} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy \quad (4.15)
\]

\[
+ 4 \sum_{k=1}^{i} \sum_{m=p(i,k)}^{q(i,k)} \left( q(i,k) - p(i,k) + 1 \right)^2 \int_{D_{k,m}^i} \int_{D_{k,m}^i} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy. \quad (4.16)
\]

Now we will consider 2 cases:

Case 1. For any \( i \in \{1, \ldots, [N^{1/4}] \} \) we have

\[
\sum_{k=1}^{i} \left( \int_{A_k^i} \varphi_1^2 \right)^{-1} \left( \int_{A_k^i} f \varphi_1^2 \right)^2 \leq \frac{1}{2}. \quad (4.17)
\]

Case 2. There exists \( i \in \{1, \ldots, [N^{1/4}] \} \) such that

\[
\sum_{k=1}^{i} \left( \int_{A_k^i} \varphi_1^2 \right)^{-1} \left( \int_{A_k^i} f \varphi_1^2 \right)^2 > \frac{1}{2}. \quad (4.18)
\]

At first we consider Case 1. Let us denote expressions in (4.14), (4.15), (4.16) by \( L(i) \), \( R(i) \), \( S(i) \) respectively.

We have \( \sum_{k=1}^{i} \int_{A_k^i} f^2 \varphi_1^2 = \int_{D} f^2 \varphi_1^2 = 1 \) so by the assumption (4.17) we have \( L(i) \geq 1 \).

Now let us assume that for some \( i \in \{1, \ldots, [N^{1/4}] \} \) we have \( R(i) \geq S(i) \). This gives \( R(i) \geq L(i)/2 \geq 1/2 \). On the other hand we have

\[
2A_{\lambda_2 - \lambda_1}^{i+1} = \int_{D} \int_{D} \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy \quad (4.19)
\]

\[
\geq \sum_{k=1}^{i} \sum_{m=p(i,k)}^{q(i,k)} \int_{D_{k,m}^i} \int_{D_{k,m}^i} \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy. \quad (4.20)
\]
By our standard arguments (4.20) is bounded below by

\[ C_1 C_2 \sum_{i=1}^N \sum_{k=1}^{q(i,k)} (\mu_{k,m}^i)^{-1} \int_{D_{k,m}^i} \int_{D_{k,m}^i} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy. \]

This is equal to \((C_1 C_2/2) R(i)\) where \(R(i)\) is the expression in (4.15). Since \(R(i) \geq 1/2\), (4.19 - 4.20) gives

\[ 2A_{2,-1}^{-1}(\lambda_2 - \lambda_1) \geq \frac{C_1 C_2 R(i)}{2} \geq \frac{C_1 C_2}{4} \geq \frac{C_1 C_2 \log(L + 1)}{4L^2}, \]

which proves (4.13).

So now we assume that for all \(i \in \{1, \ldots, [N^{1/4}]\}\) we have \(R(i) < S(i)\). This gives \(S(i) \geq L(i)/2 \geq 1/2\).

Let us observe that

\[ 2A_{2,-1}^{-1}(\lambda_2 - \lambda_1) = \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy \geq \sum_{i=1}^{[N^{1/4}]} \sum_{k=1}^{q(i,k)-1} \sum_{m=p(i,k)} \int_{D_{k,m}^i} \int_{D_{k,m+1}^i} \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy. \] (4.21)

Note that

\[ \sup_{x \in D_{k,m}^i, y \in D_{k,m+1}^i} |x - y|^3 \leq ((2i + 2)^2 + 2^2)^{3/2} \leq (20i^2)^{3/2} = C_2 i^3. \]

So by our standard arguments (4.21) is bounded below by

\[ \sum_{i=1}^{[N^{1/4}]} C_1 C_2 \frac{i}{i^3} \sum_{k=1}^{q(i,k)-1} \sum_{m=p(i,k)} (\mu_{k,m}^i \mu_{k,m+1}^i)^{-1/2} \int_{D_{k,m}^i} \int_{D_{k,m+1}^i} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy. \] (4.22)

Note that \(|q(i,k) - p(i,k) + 1| \leq 2N/i + 1 \leq 3N/i\). Hence (4.22 - 4.23) is bounded below by

\[ \sum_{i=1}^{[N^{1/4}]} \frac{C_1 C_2}{i^3} \left( \frac{i}{3N} \right)^2 \frac{S(i)}{4}, \]

where \(S(i)\) is the expression in (4.16). We assumed that \(S(i) \geq 1/2\). Therefore

\[ 2A_{2,-1}^{-1}(\lambda_2 - \lambda_1) \geq \frac{C_1 C_2}{2^{3/3} 3^{2/3} N^2} \sum_{i=1}^{[N^{1/4}]} \frac{1}{i} \geq \frac{C_1 C_2 \log([N^{1/4}] + 1)}{2^{3/3} 3^{2/3} N^2}. \]
Note that \( ([N^{1/4}] + 1)^5 \geq 2([N^{1/4}] + 1)^4 \geq 2N \geq N + 1 \). Hence \( \log([N^{1/4}] + 1) \geq (\log(N + 1))/5 \). Note also that \( L \geq N \) and a function \( \log(x)/x^2 \) is decreasing for \( x \geq 1 \). Therefore

\[
2A_{2-1}^{-1}(\lambda_2 - \lambda_1) \geq \frac{C_1C_2\log(N + 1)}{2^3 \cdot 3^2 \cdot 5N^2} \geq \frac{C_1C_2\log(L + 1)}{360L^2}.
\]

This shows (4.13) and finishes Case 1.

Now let us consider Case 2. In this case we will show the following lemma.

**Lemma 4.5.** If \( N \geq 16 \) and there exist \( i \in \{1, \ldots, [N^{1/4}]\} \) such that

\[
\sum_{k=1}^{i} \left( \int_{A_k} \varphi_1^2 \right)^{-1} \left( \int_{A_k} f \varphi_1^2 \right)^2 > \frac{1}{2}
\]

then

\[
2A_{2-1}^{-1}(\lambda_2 - \lambda_1) \geq 2C_1C_2 \left( \frac{1}{256i^3} - \frac{72}{N} \right).
\]

Before we come to the proof of this lemma (which is quite technical) let us first show how this lemma implies (4.13).

We know (Case 2) that (4.24) holds for some \( i \in \{1, \ldots, [N^{1/4}]\} \). Hence for \( N \geq 16 \) we have

\[
2A_{2-1}^{-1}(\lambda_2 - \lambda_1) \geq \frac{2C_1C_2}{256N} \left( \frac{N}{i^3} - 72 \cdot 256 \right) \geq \frac{2C_1C_2}{256N} (N^{1/4} - 18432) \cdot (4.25)
\]

When (say) \( N \geq 10^{18} \) then \( N^{1/4} \geq 3 \cdot 10^4 \) and (4.25) implies (4.13).

When \( N \leq 10^{18} \) we have \( \log(L + 1) \leq \log(N + 2) \leq 42 \). Then Remark 1.3 a) implies

\[
2A_{2-1}^{-1}(\lambda_2 - \lambda_1) \geq \frac{1}{72(L + 1)^2} \geq \frac{\log(L + 1)}{72 \cdot 4L^2 \cdot 42},
\]

which also gives (4.13).

\( \square \)

**Proof of Lemma 4.5.** Note that if \( i = 1 \) then the left hand side of (4.24) equals 0. So we may and do assume that \( i \geq 2 \).

In this proof \( i \in \{2, \ldots, [N^{1/4}]\} \) is fixed so we will drop \( i \) from the notation. We will write \( D_{k,m} \) for \( D_{i,k,m} \), \( A_k \) for \( A_i^k \), \( p(k) \), \( q(k) \) for \( p(i,k) \), \( q(i,k) \). We will also introduce the following notation

\[
a_{k,m} = \int_{D_{k,m}} f \varphi_1^2 \left( \int_{D_{k,m}} \varphi_1^2 \right)^{-1}, \quad b_{k,m} = \int_{D_{k,m}} \varphi_1^2.
\]
have similar values so
Recall that
Proof. Note that
For
Lemma 4.6.
Roughly speaking, since \( \varphi \) is "midconcave", for \( N \) large enough \( b_1, \ldots, b_i \) have similar values so \( b_k \geq c/i \) for \( k = 1, \ldots, i \). The following lemma makes the above remark precise.

**Lemma 4.6.** For \( N \geq 16 \) and any \( k = 1, \ldots, i \) we have

\[
b_k \geq 1/(32i). \tag{4.27}
\]

**Proof.** Note that \( \sum_{t=1}^{N} \int_{D_t} \varphi_1^2 = 1/2 \) and \( \int_{D_t} \varphi_1^2 \) is nonincreasing in \( l \) (\( l = 1, \ldots, N \)) so \( \int_{D_t} \varphi_1^2 \geq 1/(2N) \).

For any \( x_2 \in (-1, 1) \) the function \( x_1 \to \varphi_1(x_1, x_2) \) is concave for \( x_1 \in [-L/2, L/2] \) and attains its maximum for \( x_1 = 0 \). Hence, for any \( x_2 \in (-1, 1) \) and \( x_1 \in [-L/4, L/4] \) we have \( \varphi_1(x_1, x_2) \geq \varphi_1(0, x_2)/2 \).

Recall that \( D_t = ((l - 1)L/N, lL/N) \times (-1, 1) \). If \( l \in [-N/4 + 1, N/4] \) then \( (l - 1)L/N \geq -L/4 \) and \( lL/N \leq L/4 \). It follows that for such \( l \)

\[
\int_{D_t} \varphi_1^2(x_1, x_2) \, dx_1 \, dx_2 \geq \frac{1}{4} \int_{D_t} \varphi_1^2(0, x_2) \, dx_1 \, dx_2 \geq \frac{1}{4} \int_{D_t} \varphi_1^2 \geq \frac{1}{8N}. \]

Recall that \( A_k = \bigcup_{m=p(k)}^{q(k)} D_{k,m} = \bigcup_{m=p(k)}^{q(k)} D_{k+mi} \).

Let \( C_k = \{ m \in \mathbb{Z} : -N/4 + 1 \leq k + mi \leq N/4 \} \). For any \( m \in C_k \) we have \( \int_{D_{k+mi}} \varphi_1^2 \geq 1/(8N) \) so

\[
b_k = \int_{A_k} \varphi_1^2 = \sum_{m=p(k)}^{q(k)} \int_{D_{k+mi}} \varphi_1^2 \geq \frac{\#C_k}{8N}, \tag{4.28}
\]

where \( \#C_k \) is the number of elements of \( C_k \). We have

\[
\#C_k \geq \left[ \frac{2[N/4]}{i} \right] \geq \frac{2((N/4) - 1)}{i} - 1 = \frac{N - 4 - 2i}{2i}.
\]

We have \( i \leq N^{1/4} \) and \( N \geq 16 \) so it is not difficult to show that \( N - 4 - 2i \geq N/2 \). Hence \( \#C_k \geq N/(4i) \). Finally this and (4.28) gives (4.27). \qed
We have
\[2A_{2,-1}^{-1}(\lambda_2 - \lambda_1) = \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy\]
\[\geq 2 \sum_{k=1}^{i-1} \int_{A_k} \int_{A_{k+1}} \frac{(f(x) - f(y))^2}{|x - y|^3} \varphi_1(x) \varphi_1(y) \, dx \, dy.\]

By our standard arguments this is bounded below by
\[\sum_{m=p(k)}^{q(k+1)} \frac{C_1 C_2}{b_{k,m}^{1/2} b_{k+1,m}^{1/2}} \int_{D_{k,m}} \int_{D_{k+1,m}} (f(x) - f(y))^2 \varphi_1^2(x) \varphi_1^2(y) \, dx \, dy\]
\[\geq C_1 C_2 \sum_{m=p(k)}^{q(k+1)} (a_{k,m} - a_{k+1,m})^2 b_{k,m}^{1/2} b_{k+1,m}^{1/2}.\]

The last inequality follows from the argument which has been already used in the last 3 lines in the proof of Lemma 4.3. By Schwarz inequality it is bounded below by
\[C_1 C_2 \left( \sum_{m=p(k)}^{q(k+1)} (a_{k,m} - a_{k+1,m}) b_{k,m}^{1/2} b_{k+1,m}^{1/2} \right)^2 \left( \sum_{m=p(k)}^{q(k+1)} b_{k,m}^{1/2} b_{k+1,m}^{1/2} \right)^{-1}.\]
So (4.30) is bounded below by

\[ C_1 C_2 \left( \sum_{m=p(k)}^{q(k+1)} (a_{k,m} - a_{k+1,m}) b_{k,m}^{1/2} b_{k+1,m}^{1/2} \right)^2. \]

Now let us denote

\[ R_k = \sum_{m=p(k)}^{q(k+1)} (a_{k,m} - a_{k+1,m}) b_{k,m}^{1/2} b_{k+1,m}^{1/2}. \]

We have \( R_k = S_k + T_k + U_k + V_k \), where

\[
S_k = \sum_{m=p(k)}^{q(k)} a_{k,m} b_{k,m} - \sum_{m=p(k+1)}^{q(k+1)} a_{k+1,m} b_{k+1,m} = a_k - a_{k+1},
\]

\[
T_k = \sum_{m=p(k)}^{q(k+1)} a_{k,m} b_{k,m}^{1/2} (b_{k+1,m}^{1/2} - b_{k,m}^{1/2}),
\]

\[
U_k = \sum_{m=p(k)}^{q(k+1)} -a_{k+1,m} b_{k+1,m}^{1/2} (b_{k,m}^{1/2} - b_{k+1,m}^{1/2}),
\]

\[
V_k = -\delta_{k,r(i)} a_{k,q(k)} b_{k,q(k)} + \delta_{k,i-r(i)} a_{k+1,p(k+1)} b_{k+1,p(k+1)},
\]

where \( \delta_{x,y} = 1 \) when \( x = y \) and \( \delta_{x,y} = 0 \) when \( x \neq y \). In other words \( V_k = 0 \) when \( k \neq r(i) \) and \( k \neq i-r(i) \). In order to see why an extra term \( V_k \) appears let us recall the definition of \( p(k) \) and \( q(k) \). We have \( q(k) = \lceil N/i \rceil \) for \( k = 1, \ldots, r(i) \), \( q(k) = \lceil N/i \rceil - 1 \) for \( k = r(i) + 1, \ldots, i \) and \( p(k) = -\lceil N/i \rceil \) for \( k = 1, \ldots, i-r(i) \), \( p(k) = -\lceil N/i \rceil - 1 \) for \( k = i-r(i) + 1, \ldots, i \). A nontrivial term \( V_k \) appears only if \( q(k) \neq q(k+1) \) \((k = r(i))\) or \( p(k) \neq p(k+1) \) \((k = i-r(i))\).

We know that

\[(a + b + c + d)^2 \geq (a^2/4) - b^2 - c^2 - d^2, \quad a, b, c, d \in R,\]

so

\[ R_i^2 = (S_k + T_k + U_k + V_k)^2 \geq (S_k^{2}/4) - T_k^2 - U_k^2 - V_k^2. \]

By (4.29) we obtain

\[ \sum_{k=1}^{i-1} S_k^2 = \sum_{k=1}^{i-1} (a_{k+1} - a_k)^2 \geq \frac{1}{64 h^3}. \]
We have already obtained that

\[ 2A_{z-1}^{-1}(\lambda_2 - \lambda_1) \geq 2C_1C_2 \sum_{k=1}^{i-1} R_k^2 \]

\[ \geq 2C_1C_2 \left( \frac{1}{4} \sum_{k=1}^{i-1} S_k^2 - \sum_{k=1}^{i-1} (T_k^2 + U_k^2 + V_k^2) \right) \]

\[ \geq 2C_1C_2 \left( \frac{1}{256i^3} - \sum_{k=1}^{i-1} (T_k^2 + U_k^2 + V_k^2) \right). \] (4.31)

Now we have to estimate \( \sum_{k=1}^{i-1} (T_k^2 + U_k^2 + V_k^2) \).

By Schwarz inequality we obtain

\[ T_k^2 \leq \sum_{m=p(k)}^{q(k+1)} a_{k,m}^2 b_{k,m} |b_{k+1,m}^{1/2} - b_{k,m}^{1/2}| \sum_{m=p(k)}^{q(k+1)} \left| b_{k+1,m}^{1/2} - b_{k,m}^{1/2} \right|. \] (4.32)

We have \( b_{k,m} = \int_{D_{k,m}} \phi_1^2 = \int_{D_{k+m}} \phi_1^2 \). The sequence \( \{ \left( \int_{D_{l}} \phi_1^2 \right)^{1/2} \}_{l=-N}^{N+1} \) is unimodal and its maximum is equal to \( \left( \int_{D_1} \phi_1^2 \right)^{1/2} \).

Now there is a very important observation in the proof of this lemma. By the unimodality of this sequence we have

\[ \sum_{m=p(k)}^{q(k+1)} \left| b_{k+1,m}^{1/2} - b_{k,m}^{1/2} \right| \leq 2 \left( \int_{D_1} \phi_1^2 \right)^{1/2}. \]

We also have \( |b_{k+1,m}^{1/2} - b_{k,m}^{1/2}| \leq \left( \int_{D_1} \phi_1^2 \right)^{1/2} \).

On the other hand by Lemma 4.1 we know that \( ||\phi_1^2||_\infty \leq 9/L \) and the area \( |D_1| = 2L/N \). Hence \( \int_{D_1} \phi_1^2 \leq 18/N \).

By (4.32) we obtain

\[ T_k^2 \leq \frac{36}{N} \sum_{m=p(k)}^{q(k+1)} a_{k,m}^2 b_{k,m}. \]

Similarly we get

\[ U_k^2 \leq \frac{36}{N} \sum_{m=p(k)}^{q(k+1)} a_{k+1,m}^2 b_{k+1,m}. \]
Now we estimate $V_k^2$. Recall that $b_{k,m} \leq \int_D \varphi_1^2 \leq 18/N$. We have

$$V_k^2 \leq 2(\delta_{k,r(i)} a_{k,q(k)}^2 b_{k,q(k)}^2 + \delta_{k,i-r(i)} a_{k+1,p(k+1)}^2 b_{k+1,p(k+1)})$$

$$\leq (36/N)(\delta_{k,r(i)} a_{k,q(k)}^2 b_{k,q(k)} + \delta_{k,i-r(i)} a_{k+1,p(k+1)}^2 b_{k+1,p(k+1)})$$

It follows that $\sum_{k=1}^{i-1} (T_k^2 + U_k^2 + V_k^2)$ is bounded above by

$$\frac{36}{N} \sum_{k=1}^{q(k)} a_{k,m}^2 b_{k,m} + \frac{36}{N} \sum_{k=1}^{q(k+1)} a_{k+1,m}^2 b_{k+1,m}.$$ 

Note also that $a_{k,m}^2 b_{k,m} \leq \int_{D_{k,m}} f^2 \varphi_1^2$. Hence

$$\sum_{k=1}^{i-1} (T_k^2 + U_k^2 + V_k^2) \leq \frac{36}{N} \int_D f^2 \varphi_1^2 = \frac{72}{N}.$$ 

This and (4.31) gives the assertion of the lemma.

5 Spectral gap for convex double symmetric domains

Proposition 5.1. Let $D \subset [-L, L] \times [-1, 1]$ be open, convex and symmetric with respect to both axes. Assume $(L, 0) \in \overline{D}$, $(0, 1/2) \in \overline{D}$ and $L = l^2 + 4$ for some natural number $l \geq 3$. Then

$$\int_D f^2(x) \varphi_1^2(x) \, dx \leq 2 \cdot 10^9 c_H L^2 \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^{2+\alpha}} \varphi_1(x) \varphi_1(y) \, dx \, dy$$

for all $f \in L^2(D)$ such that $\int_D f(x) \varphi_1^2(x) \, dx = 0$, where $c_H$ denotes the constant from Corollary 3.7.

Proof. We denote by $D(a, b)$ the set $D \cap ((a, b) \times \mathbb{R})$, or $D \cap ([a, b] \times \mathbb{R})$, or $D \cap ([a, b] \times \mathbb{R})$. The latter three sets differ only by a set of a measure zero, thus the ambiguity of the definition of $D(a, b)$ will be irrelevant. We put $w(D(a, b)) = b - a$, which is the “width” of $D(a, b)$, and

$$h(D(a, b)) = 2 \inf \{ t : (x, t) \in D(a, b) \text{ for some } x \in (a, b) \} ,$$

$$H(D(a, b)) = 2 \sup \{ t : (x, t) \in D(a, b) \text{ for some } x \in (a, b) \},$$

the “heights” of the set $D(a, b)$.  

32
Let $\mu = \varphi_1^2 dx$. We fix an arbitrary $f \in L^2(D, \mu)$ such that $\int_D f d\mu = 0$ and put $F(x, y) = \frac{(f(x) - f(y))^2}{|x-y|^{\alpha+2}} \varphi_1(x) \varphi_1(y)$.

Step 1. We consider a partition of $D$ into a union of five disjoint sets $D_1 = D(-L, -L + 4)$, $D_2 = D(-L + 4, -L + 8)$, $D_3 = D(-L + 8, L - 8)$, $D_4 = D(L - 8, L - 4)$ and $D_5 = D(L - 4, L)$. Note that by unimodality and symmetry of $\varphi_1^2$ and $w(D_k)$, the sequence $\mu_k = \int_{D_k} \varphi_1^2 d\mu$ is also unimodal. Thus by Lemma 4.3 we have

\[
2 \int_D f^2 d\mu \leq 2 \sum_{k=1}^5 \frac{1}{\mu_k} \int_{D_k} \int_{D_k} (f(x) - f(y))^2 \mu(dx) \mu(dy)
+ 100 \sum_{k=1}^4 \frac{1}{\mu_k \wedge \mu_{k+1}} \int_{D_k} \int_{D_{k+1}} (f(x) - f(y))^2 \mu(dx) \mu(dy)
\leq 2(20)^{1+\alpha/2} c_3 L^2 \sum_{k=1, k \neq 3}^5 \int_{D_k} \int_{D_k} F(x, y) \, dx \, dy
+ 100(68)^{1+\alpha/2} c_3 L^2 \left( \int_{D_1} \int_{D_2} + \int_{D_3} \int_{D_4} \right) F(x, y) \, dx \, dy
+ \frac{100}{\mu_2 + \mu_3 + \mu_4} \int_{(D_2 \cup D_3 \cup D_4)^2} (f(x) - f(y))^2 \mu(dx) \mu(dy) .
\]  

(5.1)

In the above inequality we have used the fact that $\sup_{E} \varphi_1^2 \leq c_3 L^2 \int_E \varphi_1^2 dx$ for $E = D_k$, where $k \neq 3$, or $E = D_1 \cup D_2$ or $E = D_4 \cup D_5$. It turns out that one may take $c_3 = 9c_H$ (This follows from Corollary 3.7 an argument of a geometric nature is omitted). Moreover, $\text{diam}(D_k) \leq \sqrt{20}$ for $k \neq 3$ and $\text{diam}(D_k \cup D_{k+1}) \leq \sqrt{68}$ for $k = 1, 4.$

In this step we have “cut off” the ends of $D$, in a sense that it remains to estimate from above the term in (5.1)

Step 2. We now define a sequence $a_k = l^2 - \sum_{j=1}^k (2j-1)$ for $k = 1, 2, \ldots, l$, and $a_0 = l^2$. Note that $a_l = 0$. We consider a partition of $D(-l^2, l^2) = D_2 \cup D_3 \cup D_4$ into a union of $2l$ pairwise disjoint sets $D'_{-k} = D(-a_{k-1}, -a_k)$ and $D'_k = D(a_k, a_{k-1})$ for $k = 1, 2, \ldots, l$. Let $\mu'_k = \mu(D'_k)$. By a similar token as before, the sequence $(\mu'_{-1}, \mu'_{-2}, \ldots, \mu'_l, \mu'_l, \mu'_{l-1}, \ldots, \mu'_1)$ is unimodal. Thus
by Lemma 4.3 and the equality $\mu_k' = \mu_{-k}'$ we have
\[
\frac{1}{\mu(D(-l^2,l^2))} \iint_{D(-l^2,l^2)} (f(x) - f(y))^2 \mu(dx)\mu(dy) \leq 2 \sum_{k=1}^{l} \frac{1}{\mu_k'} \left( \int_{D_k'} \int_{D_k} + \int_{D_{-k}'} \int_{D_{-k}} \right) (f(x) - f(y))^2 \mu(dx)\mu(dy) \tag{5.2}
\]
\[+ 16l^2 \sum_{k=1}^{l-1} \frac{1}{\mu_{k+1}' \vee \mu_k'} \left( \int_{D_{k+1}'} \int_{D_k} + \int_{D_{k+1}'} \int_{D_{-k+1}'} \right) (f(x) - f(y))^2 \mu(dx)\mu(dy) \tag{5.3}
\]
\[+ 16l^2 \frac{1}{\mu_l'} \int_{D_l'} \int_{D_l} (f(x) - f(y))^2 \mu(dx)\mu(dy). \tag{5.4}
\]

Step 3. We will now show how to deal with the integral (5.3), i.e.,
\[
I_k = \frac{1}{\mu_{k+1}' \vee \mu_k'} \int_{D_{k+1}'} \int_{D_k} (f(x) - f(y))^2 \mu(dx)\mu(dy)
\leq \frac{1}{\mu_{k+1}' + \mu_k'} \int_{(D_{k+1}' \cup D_k')^2} (f(x) - f(y))^2 \mu(dx)\mu(dy). \tag{5.5}
\]
We have $w = w(D_{k+1}' \cup D_k') = a_{k-1} - a_{k+1} = 4k$. Let $h = h(D_{k+1}' \cup D_k')$ and $N = \left[ \frac{2k+1}{h} \right]$. We divide $D_{k+1}' \cup D_k'$ into a union of sets
\[E_j = D(a_{k+1} + (j-1)w/N, a_{k+1} + jw/N), \quad j = 1, 2, \ldots, N,
\]
of equal width $4k/N$ and apply Lemma 4.3 to such $E_j$. We obtain
\[
I_k \leq 4 \sum_{j=1}^{N} \frac{1}{\mu(E_j)} \int_{E_j} \int_{E_j} (f(x) - f(y))^2 \mu(dx)\mu(dy)
\]
\[+ 8N^2 \sum_{j=1}^{N-1} \frac{1}{\mu(E_j) \vee \mu(E_{j+1})} \int_{E_j} \int_{E_{j+1}} (f(x) - f(y))^2 \mu(dx)\mu(dy).
\]
Note that
\[
\text{dist}((D_{k+1}' \cup D_k'), (L, 0)) = 4 + (k - 1)^2 \geq 2k = w(D_{k+1}' \cup D_k')/2,
\]
thus by convexity of $D$ we have
\[
\frac{H(D_{k+1}' \cup D_k')}{h(D_{k+1}' \cup D_k')} \leq \frac{\text{dist}((D_{k+1}' \cup D_k'), (L, 0)) + w(D_{k+1}' \cup D_k')}{\text{dist}((D_{k+1}' \cup D_k'), (L, 0))} \leq 3.
\]
34
Hence \( h \leq H(E_j) \leq 3h \). Moreover,

\[
 w(E_j \cup E_{j+1}) = \frac{8k}{N} \leq 8h \frac{k}{2k+1-h} \leq 4h
\]

and

\[
 w(E_j \cup E_{j+1}) = \frac{8k}{N} \geq h \frac{8k}{2k+1} \geq \frac{8h}{3},
\]

This means that if \( S = a_{k+1} + (j-1)w/N \), then \( B((S,0),h) \subset D \) and \( |B((S,0),h/4) \cap E_j| = |B((S,0),h/4)|/2 = \pi h^2/32 \). Thus by Harnack inequality (Corollary 3.7) we obtain

\[
 \sup_{E_j} \varphi_1^2 \leq \frac{32cH}{\pi h^2} \int_{E_j} \varphi_1^2 \, dx,
\]

the same bound as above holds also for \( E_j \cup E_{j+1} \) in place of \( E_j \). Note that we take \( h/4 \) above as the radius of the ball because of the assumption concerning inner radius in Corollary 3.7.

We have

\[
 \text{diam}(E_j) \leq \text{diam}(E_j \cup E_{j+1}) \leq (w(E_j \cup E_{j+1})^2 + H(E_j \cup E_{j+1})^2)^{1/2} \leq 5h.
\]

Hence

\[
 \frac{1}{\mu(E_j) \vee \mu(E_{j+1})} \int_{E_j} \int_{E_{j+1}} (f(x) - f(y))^2 \mu(dx) \mu(dy) \leq (5h)^{2+\alpha} \frac{32cH}{\pi h^2} \int_{E_j} \int_{E_{j+1}} F(x,y) \, dx \, dy
\]

and a similar bound holds for the integral over \( E_j \times E_j \). Moreover, \( N^2 \leq (2k+1)^2/h^2 \leq 9k^2/h^2 \). Thus

\[
 I_k \leq 4(5h)^{2+\alpha} \frac{32cH}{\pi h^2} \sum_{j=1}^{N} \int_{E_j} \int_{E_j} F(x,y) \, dx \, dy 
\]

\[
 + \frac{72k^2}{h^2} (5h)^{2+\alpha} \frac{32cH}{\pi h^2} \sum_{j=1}^{N-1} \int_{E_{j+1}} \int_{E_{j+1}} F(x,y) \, dx \, dy 
\]

\[
 \leq \frac{2304 \cdot 5^{2+\alpha} cH}{\pi} \cdot k^2 h^{2-\alpha} \int_{(D_{k+1} \cup D_k)^2} F(x,y) \, dx \, dy. \quad (5.6)
\]

We have \( \text{dist}((D'_{k+1} \cup D'_k), (L,0)) = 4+(k-1)^2 \geq k^2/2 \), thus that by convexity of the set \( D \) and the assumptions \( (0,1/2) \in \overline{D}, (L,0) \in \overline{D} \) we obtain

\[
 \frac{h/2}{k^2/2} \geq \frac{1/2}{L}.
\]
When $\alpha \geq 1$ we get $k^2 h^{\alpha - 2} \leq 2 L h^{\alpha - 2} \leq 2L$. When $\alpha < 1$ we get $k^2 h^{\alpha - 2} \leq k^2 (2L/k^2)^{2-\alpha} = 2^{2-\alpha} L (L/k^2)^{1-\alpha} \leq 2^{2-\alpha} L$. For any $\alpha \in (0, 2)$ we have $k^2 h^{\alpha - 2} \leq \max(2, 2^{2-\alpha}) L$. We combine it with (5.6) and finally obtain

$$I_k \leq \frac{2880000c_H}{\pi} \cdot L \int\int_{(D_{k+1} \cup D_k)^2} F(x, y) \, dx \, dy. \quad (5.7)$$

We should also estimate from above the integral (5.4) over $D_{-l} \times D_l$. This may be done in a similar way as the integrals $I_k$ above. We obtain a similar estimate as (5.7) with slightly smaller constant, we omit the details.

To estimate (5.2) we may see that in (5.5) we have in fact estimated $I_k$ from above by an integral over $(D'_{k+1} \cup D_k)^2$. Thus a similar estimation as in (5.7) holds also for the integrals in (5.2).

We finally obtain

$$2 \int_D f^2 \, d\mu \leq \left(18 \cdot (20)^{1+\alpha/2} + 1800 \cdot (68)^{1+\alpha/2} + 100 \left(\frac{4}{L} + 32\right) \frac{2880000}{\pi}\right) \times c_H L^2 \int\int_{D^2} F(x, y) \, dx \, dy$$

and the proposition follows.

Proof of Theorem 1.4. At first assume that $L \geq 13$. For any natural number $l \geq 3$ we have

$$\frac{(l + 1)^2 + 4}{l^2 + 4} \leq \frac{20}{13};$$

thus there exists $\beta \in [13/20, 1]$ such that $\beta L = l^2 + 4$ for some natural number $l \geq 3$. By (1.9) we have

$$2\mathcal{A}_{2,\alpha}^{-1}(\lambda_2(D) - \lambda_1(D)) = \beta^\alpha \cdot 2\mathcal{A}_{2,\alpha}^{-1}(\lambda_2(\beta D) - \lambda_1(\beta D)).$$

Note that $\beta D$ satisfies assumptions of Proposition 5.1 (in particular $(0, 1/2) \in \beta D$). Hence by Theorem 1.1 and Proposition 5.1 we obtain

$$2\mathcal{A}_{2,\alpha}^{-1}(\lambda_2(D) - \lambda_1(D)) = 2\mathcal{A}_{2,\alpha}^{-1}(\lambda_2(\beta D) - \lambda_1(\beta D)) \geq \beta^\alpha \geq \frac{1}{10^9 c_H (\beta L)^2} \geq \frac{1}{10^9 c_H L^2}.$$

What remains is to consider the case $L \leq 13$.

Note that $B((0, 0), 1/\sqrt{2}) \subset D$ so by Corollary 3.7 $\varphi_1^2$ satisfies Harnack inequality on $B = B((0, 0), 1/(4\sqrt{2}))$, in particular $\varphi_1^2((0, 0)) \leq c_H \varphi_1^2(x), x \in B$. Of course $\sup_{x \in D} \varphi_1^2(x) = \varphi_1^2((0, 0))$. We have

$$c_H = c_H \int_D \varphi_1^2 \geq c_H \int_B \varphi_1^2 \geq c_H^2 \int_B \varphi_1^2(0, 0) |B|,$$
which gives \( \sup_{x \in D} \varphi_1(x)^2 \leq c_H |B|^{-1} = 32c_H / \pi \).

We also have \( \text{diam}(D) < 28 \). Let \( f = \varphi_2 / \varphi_1 \). By Theorem 1.1 we have

\[
2A_{2,\alpha}^{-1}(\lambda_2 - \lambda_1) = \int_D \int_D \frac{(f(x) - f(y))^2}{|x - y|^{2+\alpha}} \varphi_1(x)\varphi_1(y) \, dx \, dy \\
\geq \frac{\pi}{32c_H 28^{2+\alpha}} \int_D \int_D (f(x) - f(y))^2 \varphi_1^2(x)\varphi_1^2(y) \, dx \, dy \\
= \frac{\pi}{32c_H 28^{2+\alpha}} 2 \int_D f^2(x) \varphi_1^2(x) \, dx = \frac{\pi}{16c_H 28^{2+\alpha}}.
\]

Acknowledgments. The second name author thanks very much Rodrigo Bañuelos for many interesting discussions on the subject of the paper.
